Preface

The Kenya National Bureau of Statistics (KNBS) has been conducting household budget surveys periodically to provide information on household expenditure and income for updating national indicators on welfare measures. The Kenya Continuous Household Survey Programme (KCHSP) was started in 2019 to provide updated indicators and address existing data gaps on quarterly and annual basis and provide high frequency data at both national and county levels. The programme was designed with particular emphasis on updating labour indicators on a quarterly basis and household consumption expenditure on an annual basis for poverty indicators.

This report provides the latest information on consumption expenditure and welfare measures, based on data collected in 2022 on a quarterly basis. The indicators collected via the household budget surveys are key in monitoring and evaluating progress towards nationally and internationally set targets. This includes the long-term development blueprint, Vision 2030, which seeks to enhance equity and wealth creation opportunities for the poor and emphasizes on the Government's commitment to eliminate poverty as enshrined in the Bottom-up Economic Transformation Agenda (BETA). In addition, the indicators help monitor progress towards the global development agenda under the Sustainable Development Goals (SDGs) which aims at leaving no one behind in development and seeks to improve the general welfare of all citizens.

The Kenya Continuous Household Survey Programme (KCHSP) was started in 2019 to provide updated indicators and address existing data gaps on quarterly and annual basis and provide high frequency data at both national and county levels.

I would like to express my appreciation to all those who participated in the preparation of this report. In particular, I commend the KNBS Director Benjamin Avusewva for his leadership throughout the entire process. I recognize the tireless effort of the technical team that participated in the preparation of this report including Paul Samoei, Andrew Imbwaga, Silas Mulwa, Pius Ng'ang'a, George Magara, David Ngesa, Prisca Mwangi, Katra Dahir and Dennis Onchomba. I also wish to recognize the Bureau support staff for providing administrative and logistical services during the preparation of this report.

Special thanks go to the UNICEF and World Bank for financial and technical support throughout the entire exercise. In particular, I would like to express my appreciation to Precious Zikhali (World Bank), Godfrey Ndeng'e (UNICEF), Nduati Kariuki (World Bank) and Vivian Nyakangi (UNICEF) for their support during report preparation and analysis.

I encourage all our stakeholders, policy makers and researchers to make use of the information contained in this report to make informed decisions to improve the welfare of the citizens of Kenya.

MACDONALD G. OBUDHO, PhD, EBS, MBS
DIRECTOR GENERAL
KENYA NATIONAL BUREAU OF STATISTICS

Executive Summary

Background

The government has been at the forefront of efforts to reduce poverty in all its forms, in alignment with SDG Goal 1, which prioritizes poverty eradication. The poverty report for 2022, like others before it, relies on data collected from household surveys. To maintain up-to-date data, the Kenya National Bureau of Statistics has been conducting the quarterly Kenya Household Continuous Survey (KCHS) since 2019.

This survey comprises two main modules: the labor force and the other examining household consumption expenditure. These modules provide insight and assessments into labor market trends and measure welfare, respectively. However, unlike previous KCHS surveys, the 2022 report included the Women Economic Empowerment (WEE) module while the time-use module was excluded. The survey covered a wide range of levels that are a total of 50 levels of estimation, namely national, urban, rural, and 47 counties.

The current survey had a sample size of 1,500 clusters and 24,000 households. These clusters were randomized into four quarters, with each quarter comprising 375 clusters and 6,000 households. The quarterly sample was then distributed across all 47 counties using a power allocation method.

Poverty: Concepts and Measurement

The welfare measure used in this report is based on household consumption expenditure from the 2022 KCHS. This aligns with previous poverty reports for Kenya (GoK, 1997, 2000, 2007, 2015/16, KCHS 2019, KCHS 2020, and KCHS 2021) and international best practices.

The Kenya Continuous Household Survey (KCHS) collected data on both food and non-food consumption by households in Kenya. The 2022 poverty lines used were based on the methodology employed for KIHBS 2015/16, determined using the Cost-of-Basic Needs (CBN) method outlined in Ravallion (1994, 1998), and updated using the 2022 KCHS unit values. Food acquisition data is obtained from four sources: purchases, own production, own stock, and gifts or other sources. The survey utilizes a recall approach, collecting data over a 7-day period. It records the quantities and values

of purchased food items, as well as the quantities of food consumed from other sources. For food that is not purchased, a value is assigned based on representative prices from purchased items. An aggregate household food consumption value is calculated by summing the value of food from each source. Data on non-food consumption is collected in different sections of the questionnaire, depending on the frequency of purchase for each item. Certain health expenditures, such as hospital fees, are excluded from the survey as they are not considered part of normal household spending. For urban households, housing rent costs are collected, and for those who do not report rent, rent is imputed based on the characteristics of the dwelling and the household head.

The poverty lines were derived from the 2015/16 KIHBS data using the Cost-of-Basic Needs (CBN) method. The food poverty line in monthly adult equivalent terms was KSh 2,668 for rural areas and KSh 3,521 for urban areas. The overall poverty lines were KSh 4,358 for rural areas and KSh 8,006 for urban areas. The food poverty line for Kenya is estimated based on the cost of consuming 2,250 kilocalories per adult equivalent per day. The poverty measures used are the headcount index, the poverty gap index, and the poverty severity index.

Main Results

Overview of Expenditure Patterns

The findings reveal that the main source of food consumed by households nationally was purchases/stock, accounting for 83.7 per cent of total food consumption. This trend is also seen in rural areas, where more than three-quarters of food consumed came from purchases, accounting for (78.4%) of total consumption. Urban areas such as Mombasa and Nairobi City counties showed the highest share of food consumption from purchases, with (97.8%) and (97.6%), respectively. The proportion of food consumed from own production in rural areas decreased from (20.0%) in 2021 to (16.8%) in 2022.

In terms of expenditure, there has been an increase in average national food and non-food expenditure per month per adult equivalent, rising to KSh 8,030 from KSh 7,393 in 2021. Food's share in total consumption accounted for a significant portion, at 59.1 percent. In regard to residence/County, more

than two-thirds of food shared in total consumption was 65.4 percent in rural areas and 44.3 per cent in urban areas. Counties with lower mean expenditures were Turkana and Mandera, recording KSh 4,203 and KSh 4,521 respectively.

The data shows income disparities between the poor and the rich. The poorest quintile accounted for 8.5 per cent of the total consumption expenditure in rural areas in 2022, while the richest quintile accounted for almost half of total consumption. Similarly, in urban areas, the richest quintile had the highest share in consumption.

Distribution of Poverty

Estimated at individual level, the national food poverty headcount rate in 2022 was 31.7 per cent, translating to over 16 million people being unable to meet the food poverty line threshold, while the overall poverty headcount rate was at 39.8 per cent, implying that over 20 million individuals were unable to meet the overall poverty line threshold. The trends in the overall poverty headcount rate show a decrease from 36.1 per cent in 2015/16 to 33.6 per cent in 2019. The trend then changes to an increase to 42.9 per cent in 2020 then decreases to 38.6 per cent in 2021 followed by a slight increase to 39.8 per cent in 2022.

The hardcore poverty headcount rate for individuals was 7.1 per cent in 2022, meaning that over 3.6 million individuals lived in conditions of abject poverty and were unable to afford the minimum required food consumption basket, even if they allocated all their food and nonfood expenditures to food alone.

In 2022, the food poverty rate was more than 50 per cent in the following counties, which happen to be in Arid and Semi-Arid Areas (ASAL): Turkana (64.3%), Mandera (60.4%), Samburu (56.7%), and Marsabit (54.4%). The counties with the lowest food poverty rates were Nairobi City (15.8%), Nyeri (18.2%), and Kiambu (18.3%).

The seven counties with the highest overall poverty rates in 2022 were the following: Turkana (82.7%), Mandera (72.9%), Samburu (71.9%), Garissa (67.8%), Tana River (66.7%), Marsabit (66.1%), and Wajir (64.7%). The lowest overall poverty rates were in Nairobi City (16.5%), Kiambu (19.9%), Kirinyaga (23.1%), Embu (24.3%), Nyeri (26.0%), and Narok (26.2%) counties.

In 2022, hardcore poverty rates were highest in the following six counties: Turkana (42.6%), Samburu (36.0%), Marsabit (26.2%), Mandera (24.8%), Tana River (22.7%), and Busia (18.4%).

Poverty by Characteristics of the Household

Estimating the overall poverty rate at the household level in 2022 suggests that about 3 in 10 households in Kenya are poor, with a poverty gap of 8 per cent. Household poverty is higher in rural areas compared to urban areas with rates of 38 and 26 per cent, respectively, across all age groups.

In terms of the age of household head, the overall poverty rate ranges from a low of 9.6 per cent among urban households with a head aged 15-19, to a high of 46 per cent among households headed by the elderly age 70+ in rural areas.

Nationally, female-headed households have slightly higher poverty headcount rates (35.3%) compared to male-headed households at (32.6%).

Households with children had higher poverty rates (38%) compared to those with no children (24%). Rural households with children had the highest poverty headcount rate of 41 per cent in this category. Poverty headcount rate increases with household size across all domains of residence, ranging from a low of 20 per cent of households with 1 to 3 members to 60 per cent among households with 7 or more members.

Results show that households with heads in polygamous marriages are one and a half times more likely to be poor compared to their counterparts with household heads in monogamous marriages (48% vs 33%), respectively.

Child Poverty

Estimates of food, overall, and hardcore child poverty for 2022 were analyzed. Children are considered to be poor if they are living in households that have

been identified as poor based on the three poverty lines. At the national level, 33.1 per cent (7.5 million) of children (age 0-17 years) were food poor. Food poverty is higher among children in rural areas compared to children in urban areas, at 33.2 and 28.6 per cent, respectively.

At the county level, Mandera had the highest child food poverty rate at 69 per cent, while Nairobi and Kiambu had the lowest child food poverty of 19 per cent each. Despite Nairobi City having the lowest child poverty rates, it had the highest number of food poor children, with 1.8 million children.

Youth Poverty

The findings show that 4 out of 10 youth in the 15-24-year category and 3 in 10 youth in the 18-35-year category were food poor in 2022. This indicates that they are unable to meet their daily food requirements to attain at least the minimum 2,250 kilocalories for their daily energy requirements. This implies that 4.0 million youth (15-24) and 4.4 million youth (18-35) are food poor. For both youth categories, food poverty is higher in rural areas (41% and 34%) than urban areas (37% and 2%).

The top five food-poor counties (among the 15-24-year youth) are Mandera (with a food poverty rate of 86%), Turkana (74%), Marsabit (67%), Kilifi (61%), Samburu (57%) and West Pokot (57%).

Poverty Among the Elderly

According to this survey, 31 per cent (479,000) of adults aged 70+ were food poor nationally in 2022. Elderly persons living in urban areas are poorer than their rural counterparts (39% against 30%).

In terms of hardcore poverty, results show that approximately 169,000 individuals aged 60-69 years and 172,000 individuals aged 70 and older live in extreme poverty. The counties of Turkana, Mandera, Marsabit, Tana River, and Samburu are the most affected by hardcore poverty among the elderly.

Gini Index

The results show that inequality, measured using the Gini Index, has been varying across the years, with 2015/16 having an index of 39.1 per cent, 2019 having an index of 40.9, 2020 having an index of 35.9, 2021 having an index of 38.9, and 2022 having an index of 38.4.

35.3%

Nationally, female-headed households have slightly higher poverty headcount rates (35.3%) compared to male-headed households at (32.6%).

01

Introduction and Survey Methodology

The Kenya Integrated Household Budget Survey (KIHBS) provides comprehensive information on household income and expenditures that are used for measuring poverty.

1.1 Introduction

In the pursuit of fostering sustainable development and fostering inclusive societies, the global community has committed itself to the goal of eradicating poverty in all its forms by 2030, as outlined in the Sustainable Development Goals (SDGs). Poverty can take different forms, including economic, nutritional, cultural, and multidimensional. To effectively tackle poverty and enhance livelihoods, policymakers rely on access to precise and timely data. By understanding the unique economic, social and nutritional needs and circumstances of individuals and/or communities, policymakers can develop tailored strategies that address any constraints to enhancement of livelihoods.

Poverty is measured using data obtained from household surveys. The Kenya Integrated Household Budget Survey (KIHBS) provides comprehensive information on household income and expenditures that are used for measuring poverty. The 2022 Kenya Continuous Household Survey (KCHS) is the fourth consecutive year of annual poverty measurement. To address this temporal gap and ensure availability of up-to-date information on labour and poverty, the Bureau established the quarterly KCHS. The 2022 KCHS is an activity under the Eastern Africa Regional Statistics Program-for-Results with support provided by the World Bank. UNICEF supported the analysis and writing of this poverty report. This collaborative effort aims to enhance the quality and accessibility of data, facilitating evidence-based policymaking and interventions that alleviate poverty and enhance livelihoods.

The two primary modules in KCHS namely, labour and household consumption modules provide information on labour market indicators and welfare measures, respectively. Additionally, the survey collects data on household characteristics, housing, education and agricultural producer prices. One of the key features of the KCHS is its adaptability, allowing for the inclusion of additional modules to meet evolving statistical needs. In response to the

growing demand for data on women's economic empowerment, the Women Economic Empowerment (WEE) module was introduced in 2022.

1.2 Objectives of the KCHS

Data from the KCHS is used to update various indicators and address existing data gaps regularly i.e., quarterly, and annually. The labour module provides labour market indicators and facilitates the monitoring of trends and changes. The data produced is used to design, implement, and evaluate economic and social policies related to employment creation, income generation, and skills development, including vocational education and training, and related decent work policies. In addition, the data is crucial in updating the Kenya Labour Market Information System (KLMIS).

The household consumption module provides data which is used to derive poverty indicators on an annual basis. These indicators are used for evidence-based planning, monitoring living standards, and allocating national resources. The data is a crucial component used in national account statistics to estimate private consumption.

The data produced is used to design, implement, and evaluate economic and social policies related to employment creation, income generation, and skills development, including vocational education and training, and related decent work policies.

Regular data produced through the KCHS is useful in monitoring the progress of SDGs, poverty measures and other government development initiatives. Specifically, the KCHS provides Poverty Statistics for:

- Information to guide policy and programme formulation targeting the poor;
- Data to guide resource allocation to the devolved system of government;
- Estimates of private consumption for compilation of Gross Domestic Product (GDP);
- Data for monitoring progress towards achievement of SDGs 1, 2 and 10 on ending poverty and hunger and, reducing inequality;
- Annual micro-data for use in research by governments, academia, nonstate actors and the public; and
- Comprehensive information on an annual basis to inform planning and policy making.

1.3 National Economic, Social and Political Environment

In 2022, overall growth of GDP at constant prices was recorded at 4.8%. All the economic activities recorded growth except Agriculture, forestry, and fishing. Improved performances were recorded in accommodation and food service activities (26.2%), administrative and support service activities (18.1%), arts, entertainment and recreation (17.9%), and financial and insurance activities (12.8%). However, agriculture, forestry and fishing contracted by 1.6 per cent mainly attributed to the drought conditions in the period.

Gross domestic product per capita at current prices increased from KSh 237,861 in 2021 to KSh 260,024 in 2022. In the same period, Agriculture remained the dominant sector, accounting for about 21.2 per cent of the overall GDP. Industry-related activities accounted for 17.7 per cent, while service activities accounted for about 61.1 per cent of the total GDP in 2022 as shown in Figure 1.1.

The Central Bank Rate (CBR) was raised from 7.00 per cent in December 2021 to 8.75 per cent in December 2022. Lending interest rates for loans and advances also rose from 12.16 per cent in December 2021 to 12.67 per cent in December 2022. The overall credit advanced by commercial banks and non-bank financial institutions surged to KSh 6,218.2 billion by the end of December 2022. This growth was primarily driven by credit advanced to private enterprises.

Expenditure on merchandise imports increased by 17.5 per cent to KSh 2,490.8 billion while earnings from exports of goods grew by 17.4 per cent to KSh 873.1 billion in 2022. Despite the growth in total exports, it was not sufficient to offset the growth in imports, leading to the widening of the balance of trade deficit to KSh 1,617.6 billion in 2022.

In 2022, the current account balance expanded to a deficit of KSh 679.6 billion, driven by a rise in expenditure on imports of goods and services as well as increased payouts in the primary income account.

The inflation rate increased from 6.1 per cent in 2021 to 7.7 per cent in 2022 mainly due to the increase in the price of fuel and food items.

The national government revenue including grants was expected to grow by 14.9 per cent from KSh 2,230.8 billion in 2021/22 to KSh 2,562.1 billion in 2022/23 while expenditure was expected to increase by 11.4 per cent from KSh 2,926.8 billion in 2021/22 to KSh 3,260.7 billion in 2022/23. County governments' revenue was expected to increase by 2.4 per cent from KSh 445.8 billion in 2021/22 to KSh 456.4 billion in 2022/23.

The amount of funds disbursed through cash transfers for persons with severe disabilities was expected to increase by 4.3 per cent to KSh 901.3 million while cash transfer to older persons was expected to decrease by 1.2 per cent to KSh 18.0 billion during the same period. Similarly, disbursement of funds for the Hunger and Safety Net Programme (HSNP) was expected to increase by 42.6 per cent to KSh 4.6 billion in 2022/23.

1.4 Sample Design and Selection

1.4.1 Sample Design

The KCHS Programme collects data on a quarterly basis and analysis undertaken to provide quarterly national estimates of labour indicators. At the end of each year (12 months), annual estimates at the county level for both labour and poverty indicators are produced. The monitoring of labour indicators on a quarterly basis allows for analysis of changes over defined time frames to assess quarterly seasonality on labour indicators and to keep track of short-term trends.

1.4.2 Sample Size and Allocation

The 2022 KCHS marked the fourth consecutive year

of the programme's annual survey. The survey had a total of 50 study domains, namely, national, urban, rural and 47 counties. In designing the sample, the minimum sample size for anticipated integrated surveys and relative sizes of the counties were considered. The sample size for the annual survey consisted of 1,500 clusters and 24,000 households. The clusters were randomized into 4 quarters each comprising 375 clusters and 6,000 households. The quarterly sample was then distributed across all the 47 counties using a power allocation method. The 2022 KCHS exclusively employed a cross-sectional approach.

The sample allocation for the 2022 KCHS is presented in Table 1.2.

Table 1.2: Sample allocation for the 2022 KCHS

1.4.3 Sampling Frame

The survey sample was drawn from the newly created Kenya Household Master Sample Frame (K-HMSF) developed from the 2019 Kenya Population and Housing Census. The K-HMSF is composed of 10,000 clusters selected with Probability Proportional to Size (PPS) from approximately 128,000 Enumeration Areas (EAs) created during the 2019 Population and Housing Census. During development of the frame, it was stratified into 92 sampling strata, comprising urban and rural strata

in 45 counties plus Nairobi and Mombasa counties that are purely urban. The counties formed the first level of stratification.

The frame is further divided into four sub-samples (C1, C2, C3 and C4) each composed of 2,500 clusters that can each serve as independent sample frames. Whenever a larger sample size is required, any two or more sub-samples can be combined. For the 2022 KCHS, the clusters were drawn from component 1 (C1) of the frame.

1.4.4 Sampling

Two sets of units were sampled: clusters and households. The units were sampled without replacement and only those units that were preselected were visited for interviews. During the household interviews, it was anticipated that individuals would be eligible for different modules of the survey; individuals aged 15-64 years being eligible for the labour module and women aged 18 years and above for the WEE module.

1.4.5 Sampling of Clusters

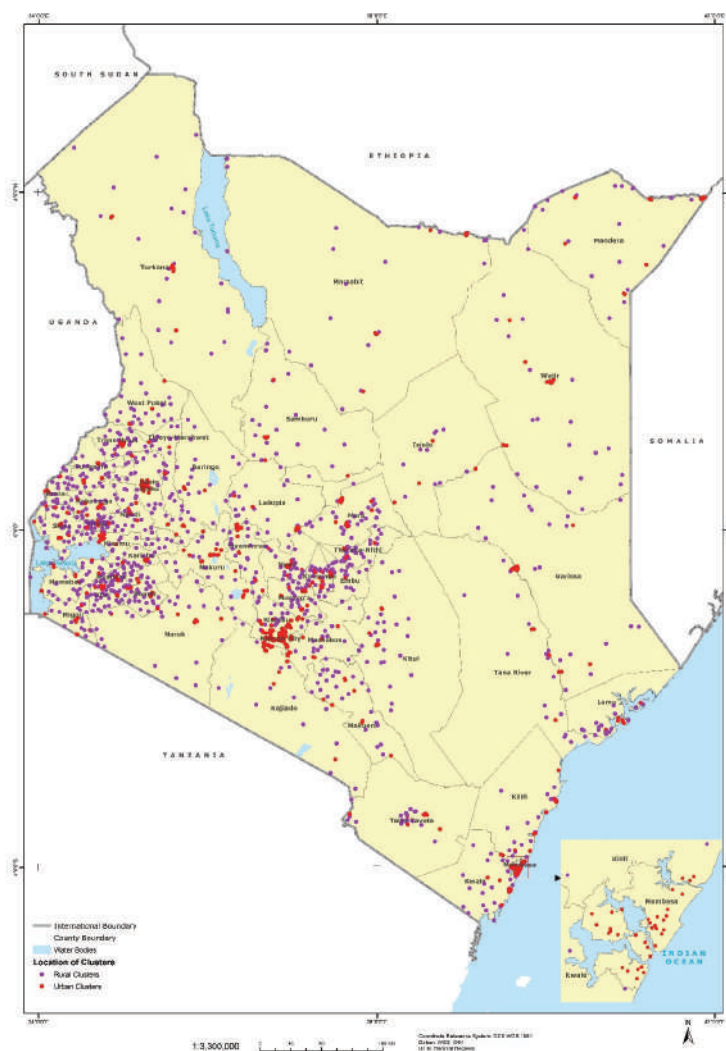

The primary sampling units (PSU) for the survey were the clusters. The clusters were selected in-

dependently from each of the 92 strata in K-HMSF frame. All the required clusters for the entire year were selected systematically with equal probability. The selected clusters from each stratum were further randomized systematically into the four quarters.

1.4.6 Sampling of Households

Simple systematic sampling method (with a random start) was applied to obtain a random sample of 16 households per cluster from the list of all households in each cluster. Sampling of the households was done at the head office and interviews were only undertaken in the preselected households.

Map 1.1: Distribution of sampled clusters for the 2022 KCHS

1.4.7 Survey Weights Computation

Since the sample for the 2022 KCHS was not self-weighting due to non-proportional allocation of the sample to the sampling strata, the data was weighted to conform to known population distribution and adjust for non-response of some sampled households. The weighted data is therefore representative of the target population and provides

reliable estimates at the national and county level.

Sampling weights, W , are calculated as the inverse of the product of the selection probabilities at each stage of sampling. The probability (P) of selecting the 2022 KCHS household is the product of 3 probabilities, P_i :

$$P = \prod_{i=1}^3 P_i$$

Where;

P_1 = the probability of selecting the EA for the K-HMSF master sample among all the EAs in the 2019 Population and Housing Census respectively;

P_2 = the probability of selecting the cluster for the 2022 KCHS, among all the clusters in the K-HMSF master sample; and

P_3 = the probability of selecting the household among all the households listed in the cluster.

The cluster weights were computed as the product of sample cluster design weight, household and cluster response adjustment factors as follows:

$$W_{ij} = D_{ij} \frac{S_{ij} C_j}{I_{ij} c_j}$$

Where;

W_{ij} = overall final cluster weight for cluster i in stratum j ;

D_{ij} = sample cluster design weight obtained from inverse of cluster selection probabilities for cluster i in stratum j ;

S_{ij} = number of listed households in cluster i in stratum j ;

I_{ij} = number of responding households to the consumption module in cluster i in stratum j ;

C_j = number of clusters in stratum j ; and

c_j = number of clusters selected from stratum j .

Additionally, the sampling weights were calibrated so that the aggregate matches the projected population number (as at mid-2022).

1.5 Survey Instruments

The questionnaire was programmed into the survey solutions software and data collection carried out using Computer Assisted Personal Interviews (CAPI). To ensure consistency and standardization in understanding concepts, a manual for the questionnaire was developed and used during training sessions. Additionally, a CAPI manual was developed to train the enumerators on how to navigate the survey solution CAPI system as well as utilizing it for quality checks during the survey. The survey design provided 4 cross-sectional survey estimates per quarter, each analysed independently and provide national and urban/rural estimates independently for each county.

1.6 Management

All the aspects of the survey from survey design, data collection, processing and analysis were managed by the KNBS. A steering committee comprising of the KNBS directors was responsible for policy direction and oversight of the survey implementation process. The steering committee constituted a secretariat responsible for the day-to-day administrative, logistical and technical operations of the survey. County field teams, consisting of enumerators, supervisors and a driver were deployed for data collection. The field teams were assisted by National Government Administrative Officers (NGAOs) who helped in locating the sampled households and providing general security to the teams while in the selected clusters. Various levels of coordination were employed to observe the data collection processes, spot check the interviewed households and ensure smooth implementation of the survey. This was in

addition to the robust logistical arrangements that covered the instrument preparation, identification and training of field personnel, publicity, data collection, analysis, and data backup.

1.7 Recruitment and Training of Staff

The enumerators engaged during the 2021 KCHS continued with data collection for the 2022 KCHS up to the month of December 2022. Prior to the commencement of data collection, a refresher training and a debrief was conducted virtually to address the issues noted in the data collected during 2021 KCHS and address the challenges encountered. The training was also necessary since a new module on time use was introduced to the 2022 KCHS. The team was supervised by a team of 10 field supervisors mainly drawn from KNBS headquarters and where the county statistics officer was available, they were the supervisor. The entire field personnel were made up of a total of 97 interviewers, 16 supervisors and 5 Survey System Administrators.

1.8 Survey Response Rates

As shown in Table 1.3, a total of 24,000 households were sampled for the survey out of which 20,887 households were found to be eligible for the household consumption module. A household is eligible if the household responded to the consumption module. A household is ineligible if it was found to have no responses in the consumption module of the survey. Of the eligible households, 17,850 households were successfully interviewed, resulting in a response rate of 85.5 per cent. The response rate was higher, at 89.2 per cent, in rural areas compared to that of urban areas at 78.9 per cent.

Table 1.3: Response rates

Residence			
Response indicator	Urban	Rural	Total
Households selected	9,024	14,976	24,000
Households eligible	7,612	13,275	20,887
Households interviewed	6,008	11,842	17,850
Household response rate	78.9	89.2	85.5

1.9 Data Processing

The 2022 KCHS data collection was undertaken using CAPI via the Survey Solutions system. This involved programming and installing the Survey Solutions data collection application into mobile devices (tablets). Through the CAPI system, the supervisors were able to assign sampled clusters and households to the interviewers.

The CAPI system was integrated with consistency and validation checks to ensure collection of high-quality data. The collected data was transmitted in real time to the central server, where a team of quality assurance coordinators monitored quality checks via a dashboard. To further check the survey data for errors, a script was developed using a STATA package. On a daily basis, the quality assurance coordinators would download the data and cross-check all variables in the data to ensure that all questions were administered as per the questionnaire. Any data discovered with errors was sent back to the teams, indicating the nature of error and how to rectify the errors. The teams would thereafter carry out revisits to the households in order to make corrections.

Data was relayed and stored in a locally secured server with adequate firewall protection to enhance data security. Furthermore, data sent by the interviewers was secured through end-to-end encryption. Upon completion of the data collection exercise, the data was downloaded, and the survey's basic modules (demographic characteristics, housing and education modules) were cleaned and prepared for weighting and analysis.

1.10 Outline of the report

The report is presented in six chapters as follows: The first chapter presents the introduction and survey methodology as well as highlights of the prevailing macroeconomic and socio-economic environment over the past five years. Chapter two explains the poverty concepts and measurement approach while Chapter three outlines the findings on consumption expenditure patterns. Chapter four focuses on poverty and inequality indicators while Chapter five presents the basic socio-economic poverty profile. Finally, Chapter six gives conclusions and recommendations based on the survey findings.

Poverty Measurement Approach

The welfare measure used in this report is based on household consumption expenditure from 2022 KCHS. This aligns with previous poverty reports for Kenya (GoK, 1997, 2000, 2007, 2015/16, KCHS 2019, KCHS 2020, and KCHS 2021) and international best practices.

This chapter provides an overview of welfare and poverty concepts and description of the methods employed for consumption and poverty measurement. Section 2.1 discusses the definition and construction of welfare measures used for poverty estimation, including adjustments made for differences in household needs based on composition. Section 2.2 outlines the computation of poverty lines, while section 2.3 explains the adjustment of nominal expenditures for spatial and temporal price differences. Section 2.4 introduces and defines the poverty indices and inequality measures used in the report.

2.1 Definition and Construction of the Welfare Measure

The welfare measure used in this report is based on household consumption expenditure from 2022 KCHS. This aligns with previous poverty reports for Kenya (GoK, 1997, 2000, 2007, 2015/16, KCHS 2019, KCHS 2020, and KCHS 2021) and international best practices. Research on the relationship between income and consumption has shown that consumption is not directly linked to short-term income fluctuations. Consumption expenditures are more stable and less variable than income. Therefore, well-being rankings based on consumption are often more consistent for households with fluctuating incomes, such as those in rural Kenya who rely on income from agricultural activities like crop farming and livestock rearing, which can be unpredictable. Collecting income data from households is also challenging, as many people struggle to report it accurately, especially those in the informal sector or with seasonal jobs, or who simply refuse to disclose it. Nominal total household consumption expenditure is calculated according to the guidelines provided in Deaton and Zaidi (2002), comprising two main components: food consumption and non-food consumption.

2.1.1 Food Consumption Component

The food consumption component comprises four sub-components: purchases, own production, own stock, and gifts or other sources. The food consumption questions used during the 2022 KCHS data

collection were the same as those used in the 2019, 2020, and 2021 rounds to collect household-level consumption expenditure. The survey gathered data on the quantities consumed from each of the four sources over a 7-day period using a recall approach. The food consumption questionnaire collected information on purchases and consumption of food, non-alcoholic, and alcoholic beverages during the recall period. It recorded the quantities and amounts paid for purchases made by the household, as well as the quantities of food items consumed from different sources. For items that were consumed but not purchased, imputed unit values were calculated using locally representative values from purchased items.

The nominal food consumption expenditure aggregate was computed as y_{ch}^F , for each household h in each cluster c was computed using the formula below:

$$y_{ch}^F = \sum_{f=1} \bar{p}_{cf} [q_{chf}^{(purchases)} + q_{chf}^{(own\ production)} + q_{chf}^{(stocks)} + q_{chf}^{(gifts)}]$$

where, f , indexes the choice set of 216 for different food items that could be consumed by each household, h , and the superscripts denote the four different sources of food consumed, respectively from: purchases; own production; stocks; and gifts or other sources. The quantity consumed from each source was valued using the median reported cluster price, \bar{p}_{cf} for each food item.

Wherever cluster-level median unit values were not available, then consumption was valued using a strata-level median followed by a county-level median unit value or an urban or rural level median with the remaining cases valued using the national item-level unit value.

2.1.2 Non-Food Consumption Component

Data on non-food consumption by households was collected in different sections of the 2022 questionnaire, with recall periods of one month, three months, or one year, depending on the frequency of purchases of the item.

Table 2.4: Summary details of the 2022 KCHS food and non-food consumption expenditure module

Section	Description of Contents
F	Food Consumption over the first One Week
G	Consumption of Non-Food over the past One Week (Fare,Airtime and Money transfer)
H	Expenditures on House Rent,Water,Electricity, Gas and Other Cooking Fuels over the last One Month
I	Expenditures on Health Care and Other Items (non durables) over the last One Month
J	Expenditures on Clothing and Footwear over the last 3 Months
K, L ,M	Expenditure on Household Goods, Furniture and Fittings over the last 12 Months
N	Expenditures on Communication, Recreation and Culture in the last 12 Months
O	Expenditure on Insurance, Financial and Miscellaneous Items over the last 12 Months
P	Expenditures on Motor Vehicles and Accessories over the last 12 Months

Regarding health expenditures, regular purchases of certain healthcare and other health-related items, such as over-the-counter medication (e.g., painkillers, de-worming, and anti-malaria medicine), are included in the household consumption aggregate. However, other infrequent health-related expenditures, such as doctor and hospital fees, were excluded for the purpose of poverty analysis. This exclusion follows the recommended best practice, which suggests including health expenditures only if they have high income elasticity regarding their transitory variance or measurement error. Most reported health expenditures, except for medication, were found to be lumpy and incidental. The argument for exclusion is that such expenditure reflects a regrettable necessity that does not increase welfare. By including health expenditures for someone who has fallen sick, an increase in welfare is registered when, in fact, the opposite has occurred. The fundamental problem is that it is not possible to measure the loss of welfare associated with being sick, which is (presumably) lessened to some extent by health expenditures. Including the latter without accounting for the former would be incorrect (Deaton and Zaidi, 2002).

Housing rental costs were also collected in the survey. These expenditures are particularly crucial for households residing in urban areas; however, households that reside in housing structures that they own do not report rent. For urban households, rent

was imputed by estimating a stepwise log-linear Ordinary Least Squares (OLS) regression of reported rents on housing characteristic variables (including location, number of rooms, construction materials, type of water supply and sanitation, and energy source for cooking), and household head employment and educational characteristics. The stepwise OLS regression explains 59.4 per cent of the reported variation in rent expenditures. Actual rent values were used for those households reporting rent.

2.1.3 Adjusting for Differences in Needs

The previous section described how the nominal measure of welfare (the total value of household consumption) was calculated at the household level. However, the ultimate goal is to obtain a measure of individual well-being. Equivalence scales are employed to convert household consumption aggregates into money-metric measures of individual welfare. Household size is the simplest factor that can be used for this purpose. However, per capita expenditure measures will underestimate the welfare of individuals living in households with a high proportion of children. Children, up to a certain age, consume less than adults. To account for intra-household differences in needs, the standard practice, starting with the earliest studies on poverty in Kenya (Greer and Thorbecke, 1986a, 1986b, 1986c), has been to use the equivalence scales developed by Anzagi and Bernard (1977a, 1977b). These adult equivalence scales dictate that age groups 0-4 years

are weighted as 0.24 of an adult, children aged 5-14 years are weighted as 0.65, and all individuals aged 15 years and older are assigned a value of unity. The Anzagi-Bernard equivalence scales are employed in this report.

2.2 Computing Poverty Lines

The 2022 poverty lines used were based on the methodology employed for KIHBS 2015/16 determined using the Cost-of-Basic Needs (CBN) method outlined in Ravallion (1994, 1998) and updated using the 2022 unit values. This method specifies a consumption bundle considered adequate for 'basic consumption needs' and then estimates the cost of this bundle using reference prices. The poverty line can be seen as the minimum expenditure required by an individual to satisfy their basic food and non-food needs.

The process for computing the poverty line is as follows:

- i. Determine a nutritional requirement for good health, this is employed as 2,250 calories per person per day, using 2015/16 KIHBS data. This standard is widely accepted.
- ii. Estimate the cost of meeting this food energy requirement using a diet (food basket) that reflects the consumption habits of households near the poverty line (e.g., those in the lowest or second-lowest quintile of the income distribution). This will be the food component z^F . A non-food component (z^{NF}) is then added to calculate the basic needs poverty line is given by: $z^{BN} = z^F + z^{NF}$
- iii. The overall poverty line is used to determine the proportion of the population that is unable to meet the minimum overall basic consumption needs (i.e., the absolute poor).

2.2.1 The Food Poverty Line

The average daily per adult equivalent calorie requirement for the population sample enumerated in the KIHBS 2015/16 is 2,250 Kcal. The sensitivity analysis conducted using KIHBS 2015/16 data established that the nutritional anchor of 2,250 Kcal used in previous poverty reports remains robust. The same food basket and food item shares based on the KIHBS 2015/16 basket were maintained; however,

the cost was updated to reflect changes in prices over time. The 2022 poverty line was updated using the unit values of food item from the 2022 KCHS. The resulting food poverty lines were KSh 2,668 and KSh 3,521 for rural and urban areas, respectively.

2.2.2 The Overall Poverty Line

The computation of the respective overall poverty lines is based on rural and urban food poverty lines. In addition to basic food needs, the overall poverty line allows for basic non-food expenditures, such as shelter, clothing, and personal care, which are essential for social participation. Like the food poverty line, the non-food Consumer Price Index (CPI) was used to update the non-food allowance for the 2021 and 2022 KCHS. The updated non-food allowance was then added to the updated food poverty line to determine the overall poverty line. The overall poverty lines in monthly adult equivalent terms were calculated as KSh 4,358 and KSh 8,006 for rural and urban areas, respectively.

2.2.3 Adjusting for Spatial and Seasonal Price Variation

Field data collection for KCHS was conducted in phases, with the first phase taking place in 2019. In the initial two phases (KCHS 2019 and 2020), data was collected for a 12-month period from January to December. However, in 2021, the data collection period changed from monthly to quarterly, meaning that field teams collected data once per quarter; this was also applied in the 2022 KCHS data collection. The number of days collected in a month or quarter varied, ranging from 20 to 24 days, due to the entry and exit of modules in the survey. In Kenya, prices vary geographically and by season, especially for certain food items. To account for these differences, an index is constructed that adjusts for cost-of-living variances over both space and time, leading to a price index referenced to national median prices in urban and rural areas. This index is developed to adjust each household's nominal consumption aggregate. The median prices used for referencing the price index are identical to those used for computing and valuing the rural and urban food basket and poverty lines. The approach developed to adjust for cost-of-living differences is based on a Paasche price index with household-specific weights derived from unit prices collected by the KCHS.

For each item, an un-weighted national, urban, and rural median price was calculated across all households reporting price consumption of the item. In addition, for each item, a cluster-level median price was computed. The price index for each household h is defined as follows:

$$P_h = \left[\sum_{k \in h(k)} w_k \left(\frac{p_k^0}{\bar{p}_k^c} \right) \right]^{-1},$$

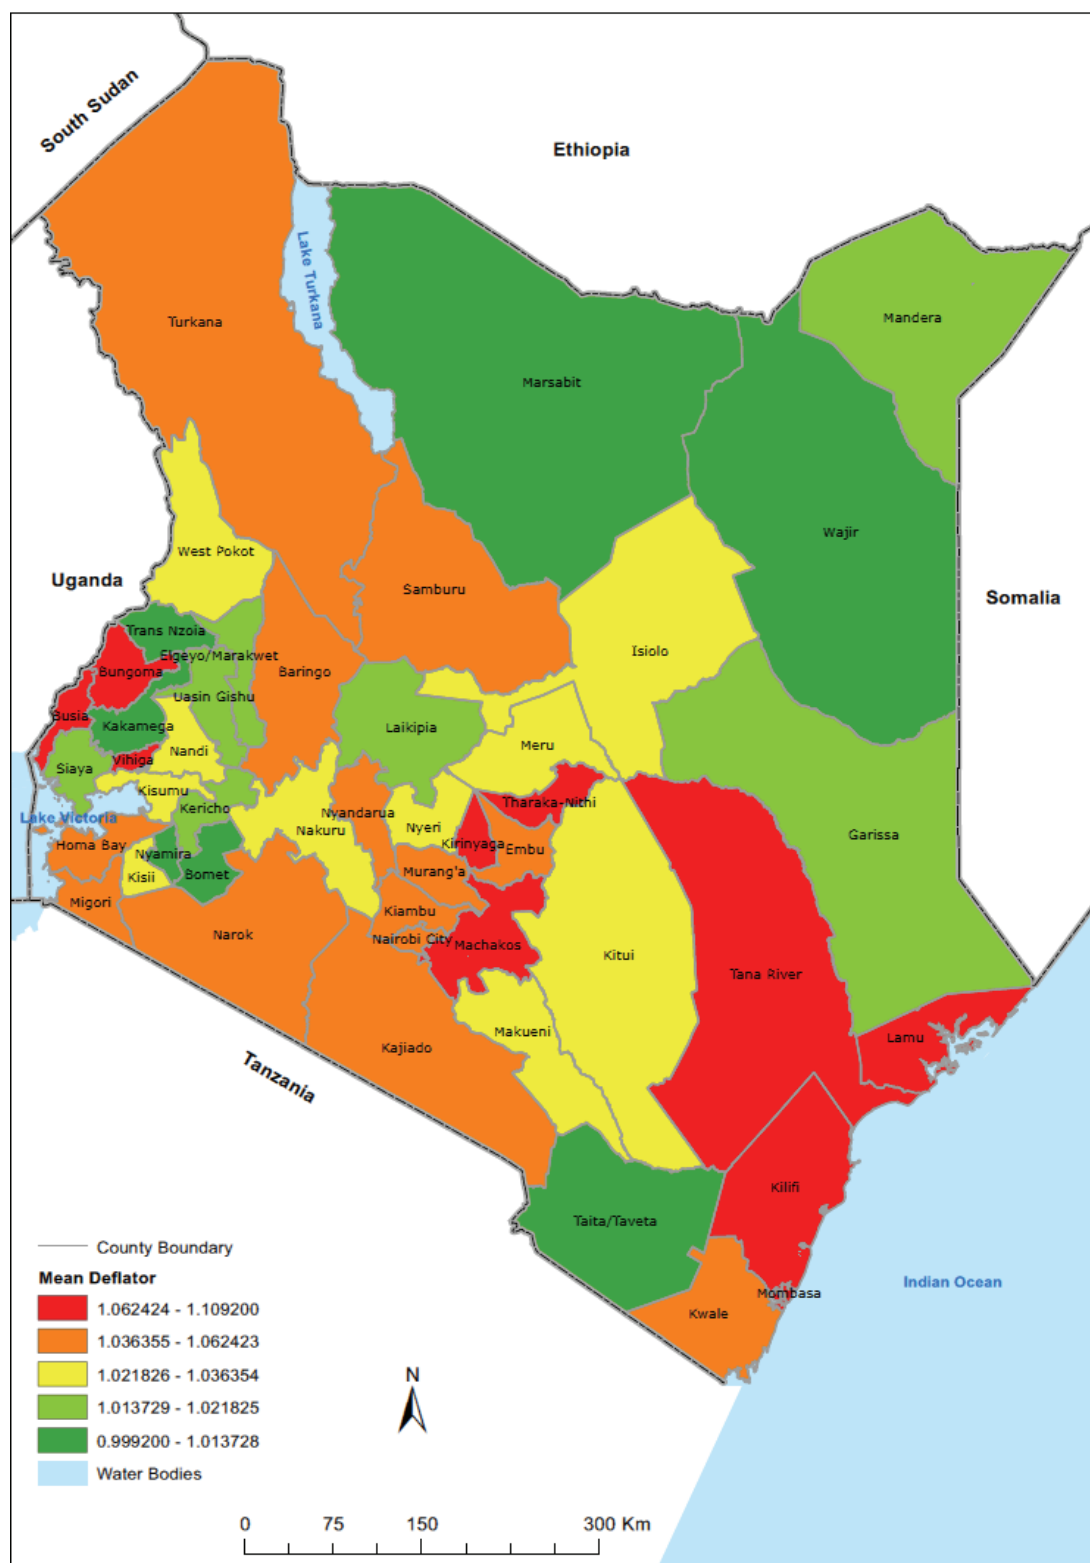

Where w_k is the share of good k in the households' food consumption basket, p_k^0 is the national, rural, or urban median price of good k (depending on whether the household is rural or urban), and \bar{p}_k^c is the cluster median unit price of good k . This Paasche price index is a household specific index that accounts for each household's expenditure pattern and adjusts for both spatial and temporal

differences. Following Deaton and Zaidi (2002), by using a logarithmic approximation and without loss of generality, the index defined above can also be expressed in a form that is computationally more convenient to implement:

$$\ln P^h \approx \sum_{k \in h(k)} w_k \ln \left(\frac{\bar{p}_k^c}{p_k^0} \right).$$

Further, note that even though the index is based on median prices, the index is household specific because it is weighted by the consumption shares of goods in each household's food consumption basket. The use of a median rather than the average reduces the sensitivity of the price index to outliers. The Paasche price index approach used in this report is identical to the approach that was used to compute poverty estimates from the KIHBS 2015/16. Figure 2.1 illustrates the importance of adjusting for temporal variation in prices during the survey period.

Figure 2.1: Seasonal variation in the average price deflator by county

2.3 Poverty Measures

A common class of poverty measures is the Foster, Greer and Thorbecke (usually referred to as FGT) indexes. The FGT measure, $P(\alpha)$, is defined as:

$$P(\alpha) = \frac{1}{N} \sum_{i=1}^N \left(\frac{z - y_i}{z} \right)^\alpha I(y_i < z)$$

Where N is the population size for which the measure is computed, y_i is the level of individual welfare (consumption per adult equivalent) of the i th individual, z is the poverty line, $I(\cdot)$ is an indicator function that maps a value of 1 when the constraint is satisfied and 0 otherwise, and α is the poverty sensitivity indicator. The FGT measure produces three different poverty indices.

2.3.1 The Poverty Headcount Index

The poverty headcount index is computed by setting $\alpha=0$ in the FGT measure so that:

$$P(0) = \frac{1}{N} \sum_{i=1}^N I(y_i < z)$$

The poverty headcount index measures the incidence of poverty. In other words, it measures the proportion of the population that cannot afford to purchase the basic basket of goods as measured by the food and overall poverty lines. The headcount index is the most used measure of poverty because it is easily understood and communicated. It is easily used to assess progress in reducing poverty over time. However, for some purposes, including the analyses of the impacts of specific policies on the poor, the poverty headcount index has some limitations. For example, the poverty headcount index would remain unchanged in a situation where a poor household become poorer. In other words, the poverty headcount index does not consider how far below the poverty line the poor are. Therefore, the poverty gap, and the poverty severity index are suitable complementary indicators to assess poverty.

2.3.2 The Depth of Poverty (the Poverty Gap Index)

The poverty gap index is computed by setting $\alpha=1$ in the FGT measure so that:

$$P(1) = \frac{1}{N} \sum_{i=1}^N \left(\frac{z - y_i}{z} \right) I(y_i < z)$$

The poverty gap index measures the depth of poverty. It provides information on how far off a household or individual is from the poverty line. This measure captures the average expenditure shortfall, or gap, for the poor relative to the poverty line. Intuitively, the poverty gap index is obtained by adding up all the expenditure shortfalls of the poor (ignoring the non-poor) relative to the poverty line and dividing this total by the population. This way, the poverty gap measures the poverty deficit of the population, or the resources that would be needed to lift all the poor out of poverty through perfectly targeted cash transfers geared towards closing the gap.

When interpreting the poverty gap measure, at least two caveats apply. First, although the poverty gap accounts for the average expenditure separating the poor from the poverty line, it does not measure inequality among poor people. For instance, a transfer of 100 shillings from the least poor person among the poor to the poorest person would not affect the poverty gap measure. Second, attempting to reach the whole population through perfectly targeted cash transfers is neither practically feasible nor always a recommendable policy option (e.g., financing transfers via excessive tax rates could stifle economic growth and, by extension, future poverty reduction). Rather this figure should be viewed as providing a useful policy benchmark by quantifying the absolute minimum level of resources required to eradicate poverty.

2.3.3 The Severity of Poverty (the Squared Poverty Gap Index)

The poverty severity or poverty gap squared index is computed by setting $\alpha=2$ in the FGT measure so that:

$$P(2) = \frac{1}{N} \sum_{i=1}^N \left(\frac{z - y_i}{z} \right)^2 I(y_i < z)$$

The poverty severity index is a better measure to assess how poor the poor are. This way, the severity of poverty gives a higher weight to those households who are further away from the poverty line. For example, consider two distributions of consumption expenditures for four people; distribution A is (1,2,3,4) and distribution B is (2,2,2,4). For a poverty line $z=3$, the headcount index for both distributions is 0.5 and 0.75 respectively while the poverty gap remains the same for the two distributions at 0.25. However, the

poorest person in distribution A has only half the consumption expenditures than the poorest person in distribution B. These differences are borne out by computing the poverty severity index which are 0.14 for A and 0.08 for B thus indicating poverty is more severe in distribution A.

The poverty severity measure, while not easy to interpret intuitively, has some clear advantages; for example, to assess the impact of policies and programmes which are aimed at reaching to poorest of the poor.

2.4 Measure of Inequality

To understand the impact of policy changes on the distribution of income or consumption expenditure requires a good understanding of their underlying distributions. Various ways to accomplish this include graphical and mathematical approaches and all of these can be used to provide a complete picture of the concentration of income/consumption expenditure, to compare and rank different distributions, and to examine the implications of alternative policy options.

Inequality refers to dispersion of the distribution over the entire consumption aggregate in this report. In this report, the Gini index, which is the most widely used measure of inequality, is used. The Gini index can be defined by referring to the Lorenz curve.

The Lorenz curve (illustrated in Figure 2.2) sorts the population from poorest to richest and shows the cumulative proportion of the population on the horizontal axis and the cumulative proportion of consumption per adult equivalent on the vertical axis. The diagonal line in a Lorenz curve indicates the equality of a distribution. The Gini index is defined as a ratio which ranges from 0 to 100: the numerator is the area between the actual Lorenz curve and the diagonal (or line of equality or uniform distribution); the denominator is the total area under the diagonal. The Gini index equals zero when all people have the same level of income or consumption (perfect equality). It equals a hundred when one person receives all the income or consumption, while everyone else has zero income (perfect inequality).

$$G = \left(\frac{1}{2n^2\mu} \right) \sum_{i,j}^n |y_i - y_j|$$

Where:

n is the number of people in the population

μ is the mean expenditure per adult equivalence

y_i and y_j are the expenditure per adult equivalence of the i th and j th persons in the population.

Figure 2.2: Lorenz curve

¹ See Yitzhaki and Schechtman (2013).

Overview of Consumption Expenditure Patterns

Household consumption expenditure encompasses all goods and services (or ‘items’) that are acquired or purchased for final consumption, including items received as gifts and consumed by the household or its individual members.

The 2022 KCHS collected details on items purchased, consumption derived from own production, stock, and gifts. Information for each food item included quantity, unit of measure, and amount paid for each item. The source of food items was categorized as purchase, own production, stocks, and gifts. Purchases denote food items bought and consumed within the reference period of 7 days preceding the data collection day. Own production refers to items produced by the households and consumed within the reference period. Gifts/in kind are items received by the household in the form of transfers from other households, the private sector, or the government within the reference period. Stock pertains to food items bought outside the reference period which is consumed within it. The value of total food consumption consists of the sum of the value of consumption from each of the four sources.

3.1 Consumption Aggregates used in the Analysis

Household consumption expenditure encompasses all goods and services (or ‘items’) that are acquired or purchased for final consumption, including items received as gifts and consumed by the household or its individual members. This definition excludes goods and services used for business purpose or wealth accumulation. The household consumption expenditure includes food, health, education, personal services and consumer durables. Moreover, income tax and other direct taxes, pension and social security contributions and assimilated insurance premiums, remittances, gifts and similar transfers by the household as a whole and its individual members are excluded from the aggregate.

The food component of consumption is categorized into the following sub-groups: cereals, bread, roots and tubers, poultry (chicken), meat, fish and sea foods, dairy products and eggs, vegetable oil and animal fats, fruits, vegetables, pulses, sugar, non-alcoholic beverages, alcoholic beverages, food eaten in restaurants and canteens, and spices and condiments.

Non-food sub-groups covers education, health expenditure (only include medication), tobacco, water, cooking and lighting fuel, household operation and personal care, transport, communication, refuse costs, domestic services (domestic workers), recreation and entertainment, clothing and footwear,

furnishings, and rent (actual or imputed). Notably, house rent is excluded for rural areas in poverty analysis.

The expenditure patterns analysis excludes the value of consumer durables, infrequent expenses such as legal fees, home repair and improvements, as well as expenditure on social ceremonies, marriages and funerals. Non-consumption expenditure items such as insurance were also excluded.

3.2 Food Expenditure by Source

Table 3.1 presents the percentage share of total food consumed in 2022 disaggregated by source. Nationally, the main source of food consumed by households was purchases/stock accounting for 83.7 per cent of total food consumption. In urban areas, nearly all food consumed was from purchases representing 94.9 per cent of total consumption. Conversely, in rural areas, this proportion was slightly lower, accounting for 78.4 per cent of total consumption. Notably, Mombasa and Nairobi City counties exhibited the highest share of food consumption from purchases with 97.8 per cent and 97.6 per cent, respectively. Elgeyo-Marakwet and Migori counties reported the lowest share, constituting approximately 62.1 per cent and 69.8 per cent, respectively, of food consumed from purchases. Moreover, the proportion of food consumed from own production in rural areas reported a reduction from 20.0 per cent in 2021 to 16.8 per cent in 2022. Marsabit and Turkana counties recorded the highest share of food consumed from gifts, at 15.1 per cent and 16.3 per cent, respectively.

The expenditure patterns analysis excludes the value of consumer durables, infrequent expenses such as legal fees, home repair and improvements, as well as expenditure on social ceremonies, marriages and funerals. Non-consumption expenditure items such as insurance were also excluded.

Table 3.1: Share of total food consumed disaggregated by source (national, residence and counties), 2022

Residence/ County	Purchase/ Stock	Own Production	Gift	Residence/ County	Purchase/ Stock	Own Production	Gift

3.3 Household Consumption Patterns

Table 3.2 shows the mean food and non-food expenditure by residence/county in monthly adult equivalent terms. The average national food and non-food expenditure per month per adult equivalent was KSh. 8,030 up from KSh. 7,393 in year 2021. Food share in total consumption accounted for 59.1 percent. In regard to residence/County, about two thirds of consumption was attributable to food in rural areas (65.8

%) and (44.8 %) in urban areas. Among the counties, households in Turkana and Siaya counties spend most of their income on food since they have the highest food shares at (78.4 %) and (71.9%) respectively. Counties with the lowest mean expenditures were Turkana and Mandera recording KSh. 4,203 and KSh. 4,521 respectively.

Table 3.2: Table 3.2: Mean monthly food and non-food expenditure per adult equivalent, 2022

County/ Residence	Expenditure			Percentage Share	
	Food	Non-food	Total	Food	Non-Food

3.4 Quintiles Analysis

The population is divided into five equal groups of 20 per cent each and the expenditure distribution is ranked from the lowest to the highest. Each of the groups is expected to account for 20 per cent share of the total expenditure for the distribution of income to be equal in all the groups.

The ratio between the mean and the median consumption expenditure can be a crude measure of inequality. The higher the ratio between the mean and the median, the greater is the inequality.

Table 3.3(a) shows the mean and median per equivalent consumption expenditure and the share of total expenditure attributable to each quintile for rural areas. The findings show that the poorest quintile accounts for 8.5 per cent of total consumption expenditure in rural areas while the richest quintile accounts for slightly below half of total consumption. The first 3 quintiles do not show significant disparities and the three combined account for

slightly above a third of the total consumption.

The counties with highest mean expenditure Kiambu and Kirinyaga show a wide disparity where the individuals in the upper quintile spent more than two thirds of total consumption at (66.2%) and (64.8%) respectively. The lowest quintile for the two counties having a small share of (0.9%) and (1.0%) respectively. Conversely, counties of Turkana and Mandera had the lowest mean expenditure and accounted for a biggest share of consumption for the lowest quintile at (47.4%) and (41.1%) and (15.3%) and (0%) going to highest quintile respectively.

In rural areas, average median expenditure, it is notable that Kiambu county had the highest median per month per adult expenditure of KSh 6,942 followed by Kirinyaga (KSh 66,57) while Turkana and Mandera counties had the lowest median per month per adult expenditure (KSh 2,586) and (KSh 2,765) respectively.

Table 3.3a: Mean and median per adult equivalent consumption expenditure (in KSh) and the consumption attributable to each quintile in rural areas

In urban areas, the situation is same as rural areas, where counties with highest mean expenditure had a higher share in consumption for richest individuals. The counties of Nairobi and Kericho recorded (58.9%) and (10.2%) of the total expenditure in upper quintile compared to (6.6%) and (9.6%) expenditure per adult equivalent share in the lower quintile respectively. The case is different for urban areas in counties with lowest mean

expenditure where the lowest quintile in Tana River and Wajir accounted for (11.6%) and (49.3%) of the total consumption expenditure.

Urban areas of Nairobi (KSh 12,831 and Tharaka-Nithi (12,776) counties recorded highest median per month per adult expenditure. Turkana and Mandera, showed the lowest median per month per adult equivalent expenditure at KSh 5,261 and KSh 5407 respectively.

Table 3.3b: Mean and median per adult equivalent consumption expenditure (in KSh) and the consumption attributable to each quintile in urban areas

Poverty Indicators

This chapter presents the main findings on 2022 poverty levels based on the welfare indicator and poverty lines discussed in Chapter 2 and summarised in section 4.1. The poverty measures at national, rural, and urban levels are presented in section 4.2. The county poverty estimates are discussed in sections 4.3. The depth and severity of overall poverty is discussed in section 4.4. Finally, a measure of inequality based on the Gini index is presented in section 4.5.

4.1 Poverty Lines

Three headcount poverty estimates are presented here based on two poverty lines: the food and overall poverty lines. The poverty measures are defined as follows:

- **Food poverty:** All individuals (or households if estimated at household level) whose food consumption per adult equivalent was less than the food poverty line of KSh 2,668 per month in rural areas and KSh 3,520 per month in urban area were considered to be food poor or live in “food poverty”.

- **Overall (absolute) poverty:** All individuals (or households if estimated at household level) whose total consumption per adult equivalent was less than the overall poverty line of KSh 4,358 per month in rural areas and less than KSh 8,006 per month in urban areas were considered to be overall poor or live in “overall poverty”.

- **Hardcore (extreme) poverty:** All individuals (or households if estimated at household level) whose total consumption per adult equivalent was less than the food poverty line of KSh 2,668 per month in rural areas and less than KSh 3,520 per month in urban areas were considered to be hardcore poor or live in “hardcore poverty”.

4.2 Summary of Poverty Measures

Table 4.1 shows the headcount poverty measures by area of residence in terms of individuals, households and adult equivalent.

Table 4.1: Summary of headcount poverty measures, 2022

Residence	Headcount Poverty Measures	Poor Individuals		Poor Households		Poor People (Adult equivalent-Adulteq)	
		(% of Population)	(Number of people in thousands)	(% of Households)	(Number of households in thousands)	(% of Adulteq)	(Number of Adulteq in thousands)
National	Food Poverty	31.7	16,062	26.5	3,449	32.1	12,975
	Overall Poverty	39.8	20,157	33.5	4,359	39.5	15,993
	Hardcore Poverty	7.1	3,607	5.8	756	7.0	2,819
Rural	Food Poverty	33.2	11,450	28.2	2,232	33.8	9,151
	Overall Poverty	42.9	14,798	38.2	3,017	43.0	11,649
	Hardcore Poverty	9.3	3,221	8.5	674	9.3	2,516
Urban	Food Poverty	28.6	4,613	23.8	1,217	28.6	3,824
	Overall Poverty	33.2	5,359	26.2	1,343	32.5	4,344
	Hardcore Poverty	2.4	387	1.6	82	2.3	303

4.2.1 Food Poverty

The national food poverty headcount rate for individuals in 2022 was 31.7 per cent, meaning over 16 million people were unable to meet the food poverty line threshold. The food poverty rate was higher in rural areas where 33.2 per cent of the rural population was living below the poverty line, that is over 11 million people in rural areas. The food poverty rate in urban areas was 28.6 per cent, implying over 4 million individuals living in urban areas were food poor. The food poor households in rural areas were around 2.2 million and in urban areas they were 1.2 million.

4.2.2 Overall Poverty

Nationally the overall poverty headcount rate for individuals was at 39.8 per cent in 2022, this implies that about 20.2 million individuals were unable to meet the overall poverty line threshold. The overall poverty rate was lower in urban areas compared to rural areas, with urban areas having a rate of 33.2 per cent and 42.9 per cent in rural areas. This translates to about 5.4 million people in urban areas and almost 15 million people in rural areas. The overall poor households in rural areas were slightly over 3 million and in urban areas were around 1.3 million.

4.2.3 Hardcore Poverty

The hardcore poverty headcount rate for individuals was 7.1 per cent in 2022, meaning that close to 3.6 million individuals lived in conditions of abject poverty and were unable to afford the minimum required food consumption basket even if they allocated all their food and nonfood expenditures to food alone. In urban areas, 2.4 per cent of the population were living in hardcore poverty compared to 9.3 per cent in rural areas. This translates to around 0.4 million people in urban areas were hardcore poor and around 3.2 million people in rural areas were hardcore poor. Rural areas had 10 times

more hardcore poor households than urban areas.

4.3 Trends in Poverty Incidence between 2015/16 and 2022

Table 4.2 summarizes the trends in poverty measures for the years 2015/16, 2019, 2020, 2021 and 2022. The trends show a decrease in the overall poverty rate from 36.1 per cent in 2015/16 to 33.6 per cent in 2019. It then increases to 42.9 per cent in 2020 partly as a result of the COVID-19 pandemic. Recovering from the pandemic, the poverty rate drops to 38.6 per cent in 2021. However, the recovery stalled in 2022 as the poverty rate rose slightly to 39.8 per cent in 2022. The trend is seen in both urban and the rural households, with urban areas experiencing larger increases in 2020. However, urban areas showed a stronger recovery. The table also shows that majority of the poor live in rural areas. Almost three quarters of the overall poor were in rural areas.

The slight increase in poverty observed between 2021 and 2022 can be attributed to several key macroeconomic trends highlighted in Table 1.1. First, there has been a notable contraction in the agricultural sector, the major source of income and jobs for the poor. This is largely due to consecutive below-average rainy seasons, notably in the Arid and Semi-Arid Lands (ASAL), resulting in the longest drought in over 40 years. Second, employment growth has been slow, hindering income generation and upward mobility. Third, the annual inflation rate increased between 2021 and 2022, indicating a rise in the cost of living. In summary, these macroeconomic trends—contraction in agriculture, slow employment growth, and rising inflation—has collectively contributed to the slight increase in poverty levels observed in 2022.

33.2%

of the **rural population** lived below the food poverty line, translating to about 11.4 million people.

28.6%

of the **urban population** lived below the food poverty line, translating to about 4.6 million people.

Table 4.2: Trends in Poverty Incidence between 2015/16 and 2022

4.4 Main County Level Poverty Estimates

4.4.1 Food Poverty Estimates, County Level

Table 4.3 gives the summary of food poverty measures for individuals across counties. The findings are further presented by the corresponding visualizations in Figure 4.1, which ranks the food poverty estimates at the county level in ascending order, from the least to the highest poverty rate. Map 4.1 visualizes county level variation in overall poverty rate.

There is substantial variation in food poverty rate across counties as visualized in Map 4.1. The following counties, which happen to be in Arid and Semi-Arid Areas (ASAL), had food poverty rates which were higher than 50 per cent: Turkana (64.3%), Mandera (60.4%), Samburu (56.7%) and Marsabit (54.4%). In some counties it was observed that for every ten people, more than four people are food poor, these include: Garissa (51.2%), West Pokot (49.3%), Kilifi

(46.3%), Tana River (46.3%), Wajir (45.6%), Busia (45.1%) and Vihiga (41.3%). In some counties, less than two people in every ten were food poor. These are: Nairobi City (15.8%), Nyeri (18.2%) and Kiambu (18.3%).

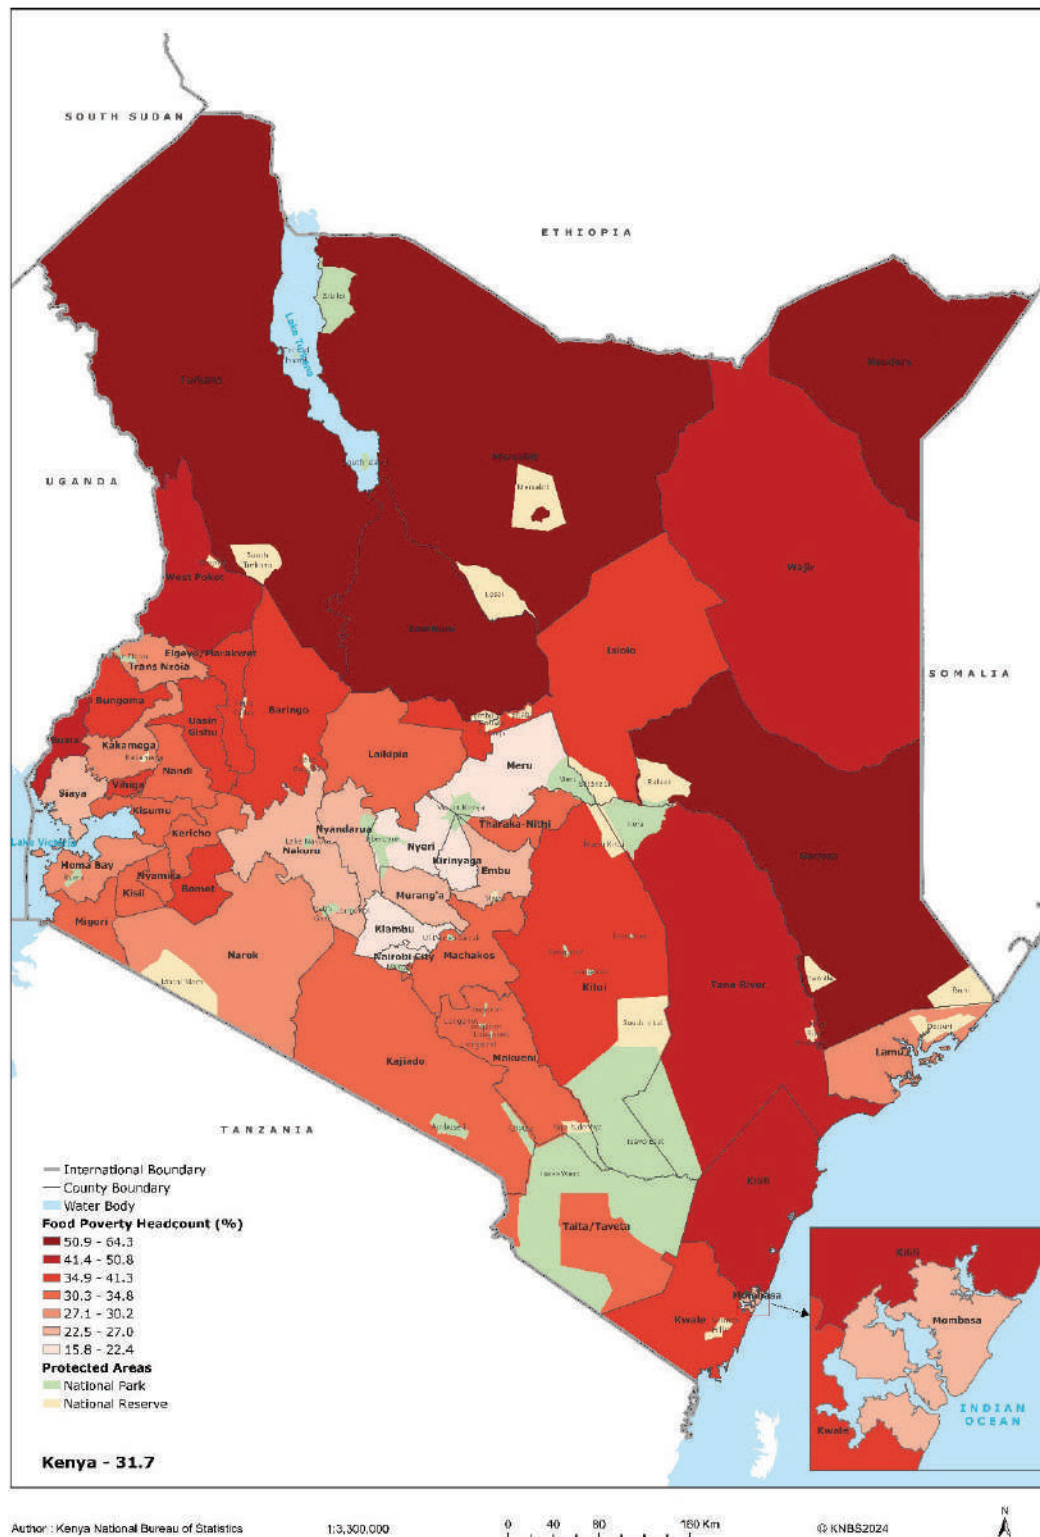

Despite having the lowest food poverty rate, Nairobi City has some of the highest numbers of food poor given its large population. The distribution of the food poor people was high in Nairobi City (4.6%), Kilifi (4.5%) and Turkana (4.0%). The three counties account for over an eighth of the total poor population.

The national food poverty gap was 7.3 per cent, with rural areas having 7.5 per cent and urban areas 6.9 per cent. Counties with high poverty gaps include Samburu (20.6%), Turkana (20.4%), Mandera (17.9%), Marsabit (15.2%) and West Pokot (14.3%). The counties with relatively low poverty gaps were Kirinyaga (2.9%), Nyeri (3.0%), Embu (3.1%), and Kiambu (3.4%).

Table 4.3: Food poverty rates (individuals) by residence and county, 2022

Figure 4.1: Food poverty rates (individuals) incidence across counties, 2022

Map 4.1: Food poverty rates (individuals) at county level, 2022

4.4.2 Overall Poverty Estimates, County Level

Table 4.4 summarizes the overall poverty measures for individuals by county, as well as the corresponding visualizations in Figure 4.2 which ranks overall poverty rates at county level in ascending order. Figure 4.3 ranks the contribution of each county to overall poverty from least to highest. Map 4.2 visualizes county level variation in overall poverty rates. Map 4.3 shows the number of overall poor people by county.

The results show a significant variation in overall poverty rates at county level, ranging from a low of 16.5 per cent in Nairobi City to a high of 82.7 per cent in Turkana. Additionally, notable differences were observed between counties in ASAL areas and counties in the rest of the country. The seven counties with the highest overall poverty rates were Turkana (82.7%), Mandera (72.9%), Samburu (71.9%), Garissa (67.8%), Tana River (66.7%), Marsabit (66.1%)

and Wajir (64.7%). Conversely, the counties with the lowest poverty rates are Nairobi City (16.5%), Kiambu (19.9%), Kirinyaga (23.1%), Embu (24.3%), Nyeri (26.0%) and Narok (26.2%).

Despite having the lowest poverty rate, Nairobi City has the fifth highest number of poor due to its large population. Bungoma, Nakuru, Kilifi, Turkana, Nairobi City and Kakamega have the highest population of overall poor people, which account for 24.4 per cent of all the poor individuals in the country.

The national overall poverty gap was 10.1 per cent, with rural areas having 10.8 per cent and urban areas 8.7 per cent. Counties with the highest poverty gaps were Turkana (35.1%), Samburu (29.1%), Mandera (24.9%) and Marsabit (24.7%). The counties with the lowest poverty gaps were Kirinyaga (4.2%), Embu (4.1%), Kiambu (4.0%) and Nairobi city (3.9%).

4.4.3 Hardcore Poverty Estimates, County Level

Table 4.5 presents the hardcore poverty measures for individuals and counties. Figure 4.4 shows the hardcore poverty rates at county level, which ranges from a low of 0.0 per cent in Kiambu county to a high of 42.6 per cent in Turkana county.

The six counties with the highest levels of hard-

core poverty rates were Turkana (42.6%), Samburu (36.0%), Marsabit (26.2%), Mandera (24.8%), Tana River (22.7%) and Busia (18.4%). Among the total population living in hardcore poverty, more than half (50.4%) reside in the following ten counties: Turkana, Mandera, Garissa, Busia, Kilifi, Kitui, Bungoma, Marsabit, Samburu and Kwale.

Table 4.5: Hardcore poverty rates (individuals) by residence and county, 2022

Figure 4.4: Hardcore poverty rates (individuals) by county, 2022

4.5 Depth and Severity of Overall Poverty, National and County Level

Map 4.4 visualizes the depth of overall poverty at the county level using the poverty gap (see Table 4.4). The poverty gap measure conveys the consumption shortfall from the poverty line.

The severity of poverty assigns greater importance to households that are farther from the poverty line and is used to evaluate the effectiveness of policies and programmes targeting the poorest of the poor. The national severity rate was 3.8 per cent, with rural areas experiencing a higher severity rate than urban areas. The five counties with high severity indices were Turkana (18.0%), Samburu (15.3%), Marsabit (11.7%), Mandera (11.3%) and Garissa (10.4%).

4.6 Inequality

Inequality is measured using the Gini index. The index measures the extent to which the distribution of consumption expenditure deviates from a perfectly equal distribution. An index of 0 expresses perfect equality where everyone has the same consumption expenditure, while an index of 100 expresses full inequality where only one person has all the consumption expenditure. Table 4.6 shows that the national Gini Index for the years 2015/16 to 2022.

The Gini index was 39.1 in 2015/16, increased slightly to 40.9 in 2019. It was 35.9 in 2020; 38.9 in 2021 and 38.4 in 2022. The index varies across counties and place of residence, with inequality being lower in rural areas compared to urban areas.

Not only is the incidence of poverty higher in rural Kenya, the rural poor tend to be farther below the poverty line.

Basic Socioeconomic Poverty Profile

Composition and household size are factors of utmost importance that have a significant impact on poverty. Large households, particularly those led by individuals with lower levels of education, as well as households residing in arid areas and households with children, are all associated with higher poverty rates.

This chapter presents poverty rates by selected socioeconomic characteristics of households, focusing on 2022. Specifically, it looks at the sex, age, education level and marital status of the household head and household size and composition, for the year 2022. It also presents poverty measures for children, youth and the elderly. For the survey, a household is defined as a person or group of persons living in the same compound (fenced or unfenced); answerable to the same head and sharing a common source of food or cooking arrangement, and/or income as a single unit. The household members have common housekeeping arrangements (they share or are supported by a common budget). A head of a household is defined as a usual household member resident in the household, who makes critical day-to-day decisions about the household and whose authority is acknowledged by all members of the household. Further, children refer to those under age 18, youth (15-24, UN) and 18-35 (Kenya's definition of youth); and the elderly are those aged 60 plus (60-69 and 70+).

5.1 Poverty by Sex and Residence of Household Head

The incidence and depth of poverty by sex and other characteristics of the household head are presented in Table 5.1. About 3 in 10 households in Kenya are poor with a poverty gap of 8 per cent. Household poverty is higher in rural areas, (38%) than in urban areas (26%). Nationally, female headed households have slightly higher poverty headcount rates (35.3%) compared to male headed households (32.6%). Across the rural-urban divide, rural female headed households had highest incidence and depth of poverty at 40 per cent and 11 per cent, respectively. Urban male headed households have the lowest poverty headcount rates and poverty gap of 26 per cent and 6 per cent respectively.

5.2 Poverty and Age of Household Head

The structure of the population plays an important role in any society, for instance, the age structure of a population forms for the diversity of roles and consumption needs and this variation can thus have far-reaching economic, social and political implications.

As shown in Table 5.1, almost half of households headed by an elderly person (70+ years), were overall poor. Households headed by individuals in the lower age groups (15-19 and 20-29) have the lowest poverty rates of 23.8 and 23.4 per cent respectively. Those in the 15-19 age group are in teenage population group with negligible (less than 1%) number of households under their headship. The likelihood of a household being poor increases with the age of the household head, from 23.4% (age 20-29) to 46% (among those age 70+).

Regardless of age of household head, poverty is higher among households in rural than urban areas, ranging from a low of 10% of urban heads (age 15-19) to a high of 46% (among the elderly age 70+) in rural areas.

5.3 Poverty and Marital Status of Household Head

This section assesses the interplay between marital status and poverty levels of the household heads among the surveyed population. Marital status has been classified into two major categories, monogamous and polygamous. Results show that households headed by an individual in a polygamous marriage are one and a half times likely to be poor compared to their monogamous counterparts (48% vs 33%). Poverty is higher among households headed by a widow compared to widowers by 9 percentage points (45 compared to 36 % respectively).

5.4 Poverty and Household Size and Number of Children

Nationally, households with children had higher poverty rates (38%) compared to those with no children (24%). Rural households with children had the highest poverty headcount rate of 41 per cent in this category. The poverty headcount rate increases with household size across all domains of residence, ranging from a low of 20 per cent of households with 1 to 3 members to 60 per cent in households with 7 or more members. Urban households with 7 members or more had the highest rate while those with 1 to 3 members had the lowest rate.

5.5 Poverty and Education Level of Household Head

Poverty is highest among households headed by an individual with no education (61%) compared to other levels of education. Poverty decreases as the level of education increases, to a low of 5 per cent for those with tertiary level of education Table 5.1.

Urban households headed by an individual with no education had the highest poverty headcount

rate of 71 per cent compared to their rural counterparts (59%).

Distribution of households by headship shows that slightly more than half (51%) of poor households were headed by individuals with primary level of education compared to only one per cent headed by those with tertiary level of education.

Table 5.1: Poverty measures and socioeconomic characteristics at household level, 2022

*The number of households headed by the 15-19 year olds are too few (less than 1%) and these should be interpreted with caution.

5.6 Child Poverty

This section provides estimates of food, overall and hardcore child poverty. Children are considered to be poor if they live in households that have been identified to be poor based on the three poverty lines. Also presented in this sub-section is the contribution of each county/residence to the national child poverty measures.

5.6.1 Child Food Poverty

The prevalence of food poverty among children refers to the percentage of all children living in households below the food poverty line. At the national level, 33.1 per cent (7.5 million) of children (age 0-17 years) were food poor in 2022. Food poverty was higher among children in rural areas compared to

children in urban areas, at 33.2 per cent and 28.6 per cent respectively. Food poverty increases with the age of the child, with 26 per cent of children age 0-5 years, 34 per cent of children age 6-13 years and peaks at 42 per cent of children age 14-17 years reported to be food poor. For children age 0-5 and 6-13, children in rural households had higher food poverty rates (27% and 23%) than those in the urban areas (35% and 32%). However, food poverty rates were higher in urban areas for the age group 14-17 years (45.1% against 41.6%). At county level, Mandera had the highest child food poverty rate at 69 per cent while Nairobi and Kiambu had the lowest at 19 per cent each. Despite Nairobi City having the lowest child poverty rates, it had the highest number of food poor children of 1.8 million children.

5.6.2 Overall Poverty among Children

Two in 5 children in Kenya live in absolute poverty. Child poverty increases with age, with 36 per cent of children aged 0-5 years, 44 per cent of children aged 6-13 years and 47 per cent of children aged 14-17 years being poor. By rural-urban differentiation, child poverty is higher among children in rural areas to urban areas at, 44 per cent and 38 per cent, respectively. At the county level, absolute child poverty ranges from a high of 81 per cent in Turkana to a low of 19 per cent each in Kiambu and Kirinyaga.

Kirinyaga. Child poverty is highest in ASAL counties with the top five counties being Turkana, Mandera, Samburu, Garissa and Wajir (Table 5.3).

At county level, absolute child poverty ranges from a high of 81 per cent in Turkana to a low of 19 per cent each in Kiambu and Kirinyaga.

5.7.3 Hardcore Child Poverty

About 8 per cent of children were hardcore poor in 2022. Hardcore poverty increases with age, with six per cent of children aged 0-5 years, eight per cent of children age 6-13 and 14-17 years being hardcore poor. In terms of rural and urban areas of residence, child hardcore poverty is 3 times higher among children in rural areas compared to urban areas at, 9 and 3 per cent respectively. At the county level, child hardcore poverty ranges from a high of 38 per cent in Turkana County to a low of less than one per cent in Kiambu, Kirinyaga and Embun counties.

At 44 per cent, child poverty was higher in rural areas compared to 38 per cent in urban areas.

5.8 Poverty among the Youth (Age 15-24 and 18-35 Years)

This section provides estimates of food, overall and hardcore poverty prevalence among the youth. Youth are categorized as those aged 15-24 and 18-34 years. Youth are considered to be poor if they live in households identified to be poor using the three poverty lines. The section also presents the contribution of each county and residence to the national youth poverty measures

5.8.1 Youth Food Poverty

The results show that 4 out of 10 of youth in the 15-24-year category and 3 in 10 of youth in the 18-35-year category are food poor. This indicates that they are unable to meet their daily food requirements to attain at least the minimum 2,250 kilocalories for their daily energy requirements. This implies that 4.0 million youth (15-24) and 4.4 million youth (18-35) are food poor. For both youth categories, food poverty is higher in rural areas (41% and 34%) than urban (at 37% and 2%), correspondingly.

The top five food poor counties among the 15-24 year youth were Mandera (86%), Turkana (74%), Marsabit (67%), Kilifi (61%) and Samburu (57%) and West Pokot (57%). Nairobi City (24%), Kiam-bu (25%), Trans Nzoia (27%) Meru and Kirinyaga (29% each) had the lowest rates. Among youth under the Kenyan definition (age 18-35 years), the same counties are leading with Mandera at the apex with a poverty headcount rate of 77 per cent and Nairobi with the least, at 14 per cent.

Table 5.5: Youth food, overall and hardcore poverty by residence, 2022

5.8.2 Youth Overall (Absolute) Poverty

Nationally, 4 in 10 (44%) and two-thirds (37%) of youth age 15-24 and 18-35 years respectively, lived in absolute poverty. This is equivalent to 4.3 million and 5.2 million youths, respectively. Among the 18-35 age group, there are more poor youth in rural areas (40%) than in urban areas (30%). The counties with the highest absolute poverty rates among youth age 15-24 years are Mandera, Turkana, Wajir, Marsabit, and Garissa, with rates exceeding 70 per cent. Among youths age 18-35, poverty rates range from a low of 16 per cent in Kiambu to a high of 86% in Mandera.

5.8.3 Youth Hardcore Poverty

Eight per cent (770 thousand) and six per cent (914 thousand) of youth age 15-24 and 18-35 respectively cannot afford the minimum basic food requirements based on their total consumption aggregates. This means that the combined expenditure on food and non-food items for this population group is below the food poverty line. Hardcore (extreme poverty) is higher among the rural youth (for both categories, 15-24 and 18-35) than their urban counterparts. Hardcore poverty among youth age 15-24 is three times higher in rural areas compared to urban areas, at 10 and 3 percent respectively; it is five times higher for those age 18-35 years in the same rural-urban category. Embu, Kirinyaga and Kiambu had negligible poverty rates, each being less than one percent. On the other hand, Turkana (39%), Mandera (36%), Tana River and Garissa (32% each), and Samburu (29%) recorded the highest hardcore poverty rates (Table 5.5).

5.9 Poverty among the Elderly (Ages 60-69, 70+)

This section presents food, overall and hardcore

povert measures among the elderly population, categorized in two groups of 60-69 years and 70+ years. The measures are presented at national, rural-urban and by county levels. Refer to Table 5.6.

5.9.1 Food Poverty

60-69 years: Three out of 10 (550, 000) persons in this age group are food poor in Kenya. There is a slight variation in the food poverty rate based on rural-urban residence (Table 5.6). At the county level, Mandera County has the highest food poverty rate, with almost 9 out of 10 (86%) elders being food poor. This is followed by Turkana (82%), Wajir and Marsabit (62% each), Kwale (55%) and Tana River (51%).

70+ Years: According to this survey, 31 per cent (479,000) of adults aged 70+ were food poor nationally in 2022. Elderly persons living in urban areas were poorer than their rural counterparts (39% against 30%). Counties in the northern parts of Kenya had the highest food poverty rates, with Mandera at 89 per cent and Turkana at 77 per cent ranking at the top-two. On the other hand, Nyeri (5%) and Kiambu (10%) had the least food poverty rates.

5.9.2 Overall Poverty

Almost half of the individuals age 70 and older are living in absolute poverty, compared to 41 per cent of those age 60-69.

5.9.3 Hardcore Poverty

The findings reveal that approximately 169, 000 individuals age 60-69 and 172, 000 individuals age 70 and above were experiencing extreme poverty. The counties of Turkana, Mandera, Marsabit, Tana River, and Samburu were mostly affected by hardcore poverty among the elderly population.

of youth aged 15-24 lived in absolute poverty in 2022.

The counties of Mandera, Turkana, Wajir, Marsabit, and Garissa had the highest absolute poverty rates of over 70 per cent among youth 15-24 years.

Conclusion and Recommendations

The recommendation is to improve poverty and inequality measurement by conducting a Market Survey to collect information on non-standard units commonly used in the markets across the country.

This report uses the 2022 KCHS as well as the three series of KCHS 2019, 2020, and 2021 to provide an overview of levels and changes in poverty during this period. It also uses the 2015/16 KIHBS to measure the changes since a major survey was conducted. The estimates reported are at national level and further disaggregated by residence (rural, urban and county)

6.1. Conclusion

The poverty line is a threshold below which an individual or a household is considered poor. The food poverty lines for rural areas were Kenya Shillings 1,954 in 2019, 2,231 in 2020, 2,331 in 2021 and 2,668 in 2022. In urban areas, the food poverty lines were Kenya Shillings 2,551 in 2019, 2,796 in 2020, 2,905 in 2021 and 3,521 in 2022.

The overall/absolute poverty lines for rural areas were Kenya Shillings 3,252 in 2019, 3,783 in 2020, 3,947 in 2021 and 4,358 in 2022. In urban areas, the overall poverty lines were Kenya Shillings 5,995 in 2019, 6,915 in 2020, 7,193 in 2021 and 8,006 in 2022.

The 2021 KCHS data showed, that nationally, the main source of food consumed by households was purchases accounting for 83.7 per cent of total food consumption. There was an increase in food consumed from purchases as shown in this report while the proportion of food consumed from own production declined in rural areas from 20.0 per cent in 2021 to 16.8 per cent in 2022. Nationally, the food poverty headcount rate was 31.5 per cent, implying that 16 million individuals were living below the food poverty line. The analysis by residence shows that the proportion of food poor people was higher in rural areas (33.2%) compared to urban areas (28.6%).

The overall poverty rate increased slightly from 37.3 per cent in 2021 to 39.8 per cent in 2022, indicating that 20.2 million people lived below the absolute poverty line. The overall poverty incidence was consistently higher in rural areas compared to urban areas. The seven counties with the highest overall poverty rates were Turkana (82.7%), Mandera (72.9%), Samburu (71.9%), Garissa (67.8%), Tana River (66.7%), Marsabit (66.1%) and Wajir (64.7%). In 2022,

the counties with the highest number of poor were Bungoma (4.4% of the total number of the poor), Nakuru (4.3%), Turkana (4.1%), Nairobi City (3.8%) and Kakamega (3.8%).

6.2. Recommendations

Although the current methodology ensures maximum comparability between the 2015/16 KIHBS 2019, 2020, 2021 and 2022 KCHS methodologies, there is need to continuously improve the way consumption and subsequently poverty is estimated in Kenya. Two possible ways to do that include: first, including the monetary value of the flow of consumption from owned durable goods, and second, including the actual and imputed housing rents for rural households depending on whether a household lives in rented accommodation or in owner-occupied housing. Any modification or improvement in the definition of the consumption aggregate as a measure of household welfare will have to be accompanied by a re-estimation of the poverty line to ensure that the poverty line is appropriate for the modified consumption aggregate.

The Kenya National Bureau of Statistics (KNBS) has conducted several household budget surveys in the past. In the absence of a standard methodology for collecting food quantities at KNBS, respondents were asked to estimate food items quantities con-

The overall poverty rate increased slightly from 37.3 per cent in 2021 to 39.8 per cent in 2022, indicating that 20.2 million people lived below the absolute poverty line in 2022.

sumed in standard or metric units, typically kilograms or litres. This method required respondents and the interviewers to convert from whatever unit they actually consumed (e.g. a bowl of rice or a tin of beans) to a standard unit. This conversion process is often an unfamiliar or difficult task for respondents and interviewers and can introduce measurement errors. Allowing respondents to report quantities directly in non-standard units (NSUs) places less of a burden on respondents and is expected to ultimately improve the accuracy of the information they provide.

In other cases, the food items consumed by the household using non-standard units, requires the interviewer to measure the solid items using weighing scales and measuring cylinders for liquid items.

Most of these items were already consumed by the households and hence could be obtained for measurement. These approaches in the survey implementation introduces errors in the analysis of poverty and CPI indicators. The recommendation is to improve these measurements by conducting a Market Survey to collect information on non-standard units commonly used in the markets across the country to give the following:

1. National and county conversion factors for all item-unit combinations (cups of rice, heaps of tomatoes, etc.) to standard units;
2. Reference photos of non-standard units' sizes, to generate a photo reference book guide of the most commonly used NSUs;

Glossary

Commodity Classification Used in Poverty Analysis

Aggregation of Food Expenditure

Cereals, Grains, Bread and Cereals Product (rice, maize grain, green maize, maize flour, popcorn, wheat grain, wheat flour, millet grain and flour, cassava flour, sorghum grain and flour, porridge flour, soya and other grain flour, barley and other cereals, cost of milling, breakfast cereal/oats, pasta, cakes, Biscuits, bread, wheat buns /scones, Pasta (spaghetti, macaroni, noodles))

Pulses (Beans, green grams, dolicos, peas, ground-nuts, macadamia, cashew nuts, cowpeas, chicken peas, tinned foods)

Meat (beef, minced meat, pork, mutton/goat meat, camel meat, chicken meat, Rabbit meat, sausages/smokie/hot dog, offals, beef brawn, pork brawn/bacon, ham, canned beef/ham/Salami, tinned meat soups, meat paste for hamburger, other meats products)

Fish and Sea Food (fish, fish fillet, prawns /other sea foods, tinned fish, omena)

Milk, Cheese and Eggs (cow /goat/camel milk, condensed/powder milk, tinned baby milk, milk sour, yoghurt, cheese, eggs)

Oils and Fats (butter, ghee, margarine, cooking fat, cooking oil, lard, peanut butter, other oils and fats)

Fruits (ripe banana, oranges, paw paws, avocado, strawberries, melons, mangoes, pineapples, passion, pears, peaches, plums, apples, lemons, grapefruit, grapes, coconut, Guavas, Lime, loquats, tangerines, tree tomato other fruits/berries)

Vegetables (onions, cabbages, carrots, tomatoes, spinach, kale/Sukuma-wiki, capsicums, cucumber, French beans, runner/broad bean, peas (garden/snap/snow), lettuce/celery, courgette/squash/marrow, traditional vegetables, beetroot, pepper, broccoli/Radish, baby and sweet corn, mushrooms, cauliflower, aubergines, pumpkins/butter nut, turnips, coriander leaves, other vegetables, cooking bananas, tinned/packeted vegetable).

Roots and Tubers (Potatoes, sweet potato, arrow roots, cassava, yams, other roots and tubers)

Sugar, jam, honey, chocolate and other confectionery (sugar, sugar cane, jaggery, sugar-icing, jam, honey, marmalade, honey, chocolate bar, sweets, chewing gum, other sugar/confectionary)

Food products n.e.c. Spices & Miscellaneous (common salt, magadi, tomato/chilli sauce, food seasoning, pilau masala, ginger-tangawizi, mustard, pickles, vinegar, crisps, baking powder, yeast, other food n.e.c /spices)

Coffee, tea and cocoa (coffee, tea leaves, cocoa and cocoa products, soya drink, other coffee, tea and cocoa)

Mineral water, soft drink, fruit and vegetable juices (mineral water, squashes, sodas, energy/health drink, fruit juice, other drinks)

Restaurants, cafes and the like (hotels and restaurant prepared foods, cafe and take-away, hotel and restaurant; beverages, cakes and snacks, other hotel food)

Canteen/kiosks services (food from canteen/kiosks, food from vendors, other kiosks/canteen expenses)

Spirits, wine and beer (vodka, whisky, rum, chang'aa, other spirits, wine, beer, traditional beer, brandy)

Tobacco/stimulants (cigarettes/cigars, tobacco pipe/raw(snuff), miraa, other stimulants)

Aggregation of Non-Food Expenditure

Education (tuition fees, books & other materials, uniform, boarding fees, transport, contribution for school building or maintenance, extra tuition fees, examination fees, PTA & other related fees, pocket money & shopping, other expenses)

Health expenditure only included medication (anti-worms, liver salts and other anti-acids, cold tablets/cough syrup, balms, vaccines, contraceptives, multivitamin/other medicine, fever/pain killers, anti-malaria medicine, cod/halibut liver oil, ARVs, epileptic drugs, insulin, hypertension, antidepressant drugs, asthmatic drugs)

Fuel (non- transport) (electricity, other lighting, battery, firewood, animal waste/biomass residue, straw or stalk/biomass residue, charcoal, kerosene/paraffin, Gas/LPG)

Household Operation and Personal Care (soap, detergents, dish washing paste/liquid, insecticide, disinfectant, air freshener, floor polish, broom, mop/duster, shoe polish /cream, match box, candles, laundry), haircut, sanitary pads, cotton wool, baby oil, baby powder, hair oil, perfume, massage, hair dressing, razor/blade, combs, toothbrush, toilet soap, toilet paper, toothpaste, after shave lotion, body lotion, hair cream, shampoo/conditioner, deodorant, tissue paper/handkerchiefs, petroleum jelly, nail polish, lipstick, eye make-ups, feeding bottle, and potty, jewelry, belts, watches, purses/handbags, wallets, suitcase/briefcase, travel bags, umbrellas, personal torches, clock, smoke pipes, lighters)

Transport (petrol, diesel, ferry/road tolls, taxi fare, parking charges, city bus fares, country bus fare, matatu fares, boda boda fares, train fares, local flights, spark plugs/points, clutch plate, brake lining, brake pads, fuel filter, oil filter, other car parts, car alarm, car insurance, driving lessons, international flights)

Communication (local calls, trunk calls, cell phone airtime, internet costs, telephone installation, cellular handset, fixed line telephone costs)

Refuse costs (refuse collection, sewage collection, toilet emptying services)

Domestic services (domestic workers)

Recreation (video cassette hire, films purchase/developing, cinema entry fees, stadium entrance fees, national /game park entry fees, traditional dances, disco/night club entry fees, gambling/lottery tickets, books, newspapers, magazines, blank cassette/CD/DVD, records musical, photography service, pre-recorded cassettes, toys and games, hotel accommodation, tour packages, club membership fees, sports/games charges, other recreation/entertainment)

Clothing and footwear (men's clothing, women's clothing, children's clothing, infant's clothing, dress /clothing material, men's footwear, women's footwear, boy's footwear, girl's footwear)

Furnishings (glassware/tableware and utensils, door mats, curtains and accessories, bed covers, bed sheets, blankets, pillows, mattress, towels, tablecloth/mats, mosquito net, pillowcases)

Rent (included only for urban households): actual rent or imputed rent based on characteristics of the housing structure, tenure status, number of habitable rooms, water and sanitation (main source of water, the main toilet facilities, garbage disposal, cooking and lighting fuel).
