Multiple Indicator Cluster Survey 2011

July, 2013

The Kisumu County Multiple Indicator Cluster Survey (MICS) was carried out in 2011 by Kenya National Bureau of Statistics in collaboration with County and Provincial administration. Financial and technical support was provided by the United Nations Children's Fund (UNICEF).

MICS is an international household survey programme developed by UNICEF. The Kisumu County MICS was conducted as part of the fourth global round of MICS surveys (MICS4). MICS provides up-to-date information on the situation of children and women and measures key indicators that allow countries to monitor progress towards the Millennium Development Goals (MDGs) and other internationally agreed upon commitments. Additional information on the global MICS project may be obtained from [www.childinfo.org](http://www.childinfo.org). In Kenya, this information is important to guide the planning and implementation of new development plans targeting the new administrative county-levels of governance.

## Foreword

---

The lives of children and women have improved significantly in the recent past, both at the global and national level. In spite of this, statistics and data presented at national levels often conceal disparities evident among the poor households in terms of access to basic services such as health care, education and protection. In addition, urban residents often present higher levels of achievement in most of the indicators compared to their rural counterparts. This may be attributed to their proximity to essential services ranging from infrastructure to provision of improved services like electricity and piped water.

The Multiple Indicator Cluster Survey (MICS) 2011 was conducted to provide comprehensive and disaggregated data to fill the existing gap, particularly at the county level. The survey, which was the first of its kind to be conducted at the devolved level, was a follow-up to the MICS 2008 conducted in 13 districts in Eastern Province and the 2009 Mombasa Informal Settlement Survey. The objective of Kisumu MICS 2011 was to provide lower-level estimates relating to children and women residing in the six counties of the region. Particular emphasis was on reproductive health, child health and mortality, nutrition, child protection, childhood development, water and sanitation, hand washing practices, education, disability and HIV/AIDS, and orphanhood.

The results of Kisumu MICS 2011 presented in this Report will therefore provide requisite baseline information and facilitate evidence-based planning and programming by policymakers and stakeholders in the development sphere.

This Report is a culmination of concerted efforts of various organizations and individuals. I acknowledge the technical and financial assistance from the United Nations Children's Fund (UNICEF). I sincerely applaud the UNICEF Kenya Country Office staff, lead by Dr. Robert Ndugwa- Research and Evaluation Specialist, for diligently managing and availing technical oversight of both the survey and report production. I also commend the hard work and dedication of Kenya National Bureau of Statistics (KNBS) staff, under the capable leadership of Mr. Macdonald Obudho – Director of Population and Social Statistics and Mr. James Gatungu- Director Production Statistics in the planning and implementation of the Survey.

I remain indebted to households for generously and voluntarily responding to survey questions and allowing the survey teams to measure the weights and heights of children below 5 years of age.

I urge all stakeholders to use the information presented in this report to impact positively on the lives of our people.

**Zachary Mwangi**  
**Director General**  
Kenya National Bureau of Statistics

# Executive Summary

---

The Kisumu County Multiple Indicator Survey (MICS) is a representative sample survey conducted in 2011 and was drawn using the 2009 Kenya Population and Housing Census. The urban and rural areas within Kisumu County were identified as the main sampling strata and the sample was selected in two stages. The primary sampling units (PSUs) were the enumeration areas (EAs) while the households were the ultimate units. A total of 50 EAs were sampled using the Probability Proportional to Size (PPS) sampling methodology. After a household listing was carried out, a systematic sample of 25 households was drawn in each sample enumeration area. Information from a total of 1,119 households was collected from 5,260 household members, 2,607 males and 2,653 females. About 46 per cent of the sampled households' population is below 15 years, 49 per cent are aged between 15-64 years and 5 per cent are aged above 65 years.

The survey was implemented by the Kenya National Bureau of Statistics (KNBS) with technical support from UNICEF Kenya. The survey provides valuable information on the situation of children and women in Kisumu County, and was largely based on the need for high quality and sufficiently disaggregated county level MICS data as Kenya transitions from a central to a devolved governance structure in 2013.

The summary of the findings from the survey are presented below.

## Child Mortality

---

For the ten year period preceding the survey, the neonatal, infant and under-five mortality rates are 23, 75 and 105 deaths per 1000 live births respectively. The estimated child mortality rate is 33 deaths per 1000 children surviving to the first birthday in the same period.

## Nutritional Status, Breastfeeding and Low Birth weight

---

Based on WHO standards, approximately 15 per cent of children under age five in Kisumu County are moderately or severely underweight

whilst 2 per cent are classified as severely underweight. About 24 per cent are moderately or severely stunted or too short for their age whilst about 9 per cent are severely stunted. Additionally, 4 per cent are moderately or severely wasted or too thin for their height. Four per cent of the children are classified as overweight.

Only 43 per cent of children in Kisumu County are promptly breastfed for the first time (within one hour of birth), and only 39 per cent of children aged less than six months are being exclusively breastfed. Overall, 42 per cent of children aged less than 2 years are appropriately fed for their age. It is noteworthy that despite the risk of contamination, bottle feeding is still occurring in Kisumu County, with 12 per cent of children aged 0-23 months reported to have been bottle fed.

Seventy two per cent of children in Kisumu County are weighed at birth and it is estimated that 6 per cent are born with low birth weight.

## Iodization and Vitamin A supplementation

---

The majority (90 per cent) of all households in Kisumu County consume salt containing the recommended levels of iodine (15 ppm).

Within the six months prior to the MICS, 44 per cent of children aged 6-59 months received a high dose Vitamin A supplement.

## Immunization

---

Sixty four (64) per cent of children in Kisumu County receive the recommended vaccinations by their first birthday. The majority (99 per cent) of children in Kisumu County receive the BCG vaccine by their first birthday whilst 77 per cent and 87 per cent receive the 3rd doses of Polio and DPT vaccination by their first birthday respectively. Ninety (90) per cent of children have received their measles vaccine, and 83 per cent have been immunised against yellow fever. Sixty five (65) per cent of women who have had a live birth in the last 2 years are protected against tetanus.

## Care of illness

---

Eighteen (18) per cent of under five children had diarrhoea in the two weeks preceding the survey. Two out of every five (40 per cent) of children with diarrhoea receive oral rehydration solutions (ORS) or other recommended homemade fluids. About 38 per cent of children receive oral rehydration therapy with continued feeding.

Six (6) per cent of children aged 0-59 months were reported to have had symptoms of pneumonia during the two weeks preceding the survey. Only a little more than half (52 per cent) of children with suspected pneumonia are taken to an appropriate provider. Only 63 per cent of children under five years of age with suspected pneumonia received an antibiotic during the two weeks prior to the survey.

## Malaria prevention

---

The level of net ownership in Kisumu County is high with 89 per cent of households having at least one insecticide treated net and 92 per cent having at least one mosquito net. About 84 per cent of children under the age of five slept under any mosquito net the night prior to the survey and 78 per cent slept under an insecticide treated net. Similarly, 90 per cent of pregnant women slept under any mosquito net the night prior to the survey and 83 per cent slept under an insecticide treated net.

About one in every four (26 per cent) of under five children were ill with malarial fever in the two weeks prior to the survey. About 2 out of every 5 (39 per cent) of children who had fever in the last two weeks were treated with artemisinin combination drugs (the recommended first line anti-malarials and 52 per cent received any anti-malarial drugs. Thirty seven (37) per cent of children receive anti-malarial drugs within 24 hours on or on the next day after onset of symptoms.

Only 19 per cent of pregnant women who gave birth in the two years preceding the survey received the recommended IPTp dose (2 or more times).

## Solid fuel use

---

The majority (91 per cent) of households in Kisumu County used solid fuels for cooking with the most common fuel being charcoal and wood.

## Water and sanitation

---

Almost half (48 per cent) of the Kisumu household population uses drinking water from an improved source. The main improved source of drinking water is public tap/stand pipe while surface water is the most common source of unimproved drinking water. About 7 out of 10 (71 per cent) of those who use unimproved drinking water sources use an appropriate water treatment method, the most common method being the addition of bleach/chlorine (54 per cent).

A quarter of the households use non-shared improved sanitation facilities. Of households using improved sanitation facilities, 33 per cent using a pit latrine with slab, 10 per cent using a flush system and 7 per cent using ventilated improved pit latrines. The pit latrine without a slab is the most commonly used unimproved sanitation facility (35 per cent). Less than 10 per cent of the household populations have no sanitation facilities.

In 78 per cent of cases, stool of children age 0-2 years are disposed of safely. Eleven per cent of households had designated handwashing places observed, and both soap and water were present in 69 per cent of these households. About 93 per cent of the households have soap somewhere in the dwelling.

## Reproductive health

---

The Total Fertility Rate in Kisumu County during the 3 years preceding the MICS survey was 4.8 children per woman. The adolescent birth rate was 199 births per 1000 women during the same period. Interestingly, although fertility increased in the 15-19 and 20-24 age groups, it generally declined in the 25-29 and 30-34 age groups over the last decade before the MICS survey.

The proportion of women aged 15-19 years who have begun childbearing (teenage pregnancy) is 34 per cent. Eight per cent of women aged 15-49 years have had a live birth before age 15 while 39 per cent of women aged 20-49 years have had a live birth before age 18.

Forty-three per cent of women who are currently married or in union use a modern contraceptive method while 1 per cent use traditional methods. Injectable contraceptives are by far the most popular method and are used by one in four (25 per cent) married women.

Coverage of antenatal care by any skilled personnel is relatively high with 95 per cent of women who gave birth in the two years preceding the survey receiving antenatal care. Antenatal care was most frequently provided by a nurse or midwife (61 per cent). At least nine in ten mothers (92 per cent) received antenatal care more than once whilst more than half (52 per cent) of mothers received antenatal care at least four times.

In the two years preceding the survey, more than half (56 per cent) of births were delivered in a health facility and 58 per cent were delivered by skilled personnel.

## Childhood development

---

In Kisumu County, 53 per cent of children aged 36-59 months are attending pre-school. About 31 per cent of under-five children engaged with an adult household member in more than four learning activities during the 3 days preceding the survey. Only 6 per cent of children are living in households where at least 3 children's books are present. About 42 per cent of children aged 36-59 months are developmentally on track. Also approximately 42 per cent of children were left with inadequate care in the week preceding the survey.

## Literacy and Education

---

In Kisumu County, about 90 per cent of women aged 15-24 are literate. Only 74 per cent of children who are currently attending the first grade of primary school were attending pre-school the previous year. The primary school completion rate is 88 per cent but transition to secondary school is

67.3 per cent. The net primary school attendance rate is 76 per cent, while that of secondary school stands at 18 per cent.

## Child protection

---

In Kisumu County, 53 per cent of children aged 36-59 months are attending pre-school. About 30 per cent of under-five children engaged with an adult household member in more than four learning activities during the 3 days preceding the survey. Only 6 per cent of children are living in households where at least 3 children's books are present. About 42 per cent of children aged 36-59 months are developmentally on track.

## Literacy and Education

---

In Kisumu County, about 90 per cent of women aged 15-24 are literate. Only 74 per cent of children who are currently attending the first grade of primary school were attending pre-school the previous year. About a quarter of children who are of primary school age enter grade 1. The primary school completion rate is 91 per cent while the transition rate to secondary school is 67 per cent.

## Child protection

---

Only 53 per cent of children under five years in Kisumu County have had their births registered. Amongst children whose births are not registered, only 14 per cent of mothers/caretakers reported knowing how to register birth.

Almost half (46 per cent) of children aged 5-14 years in Kisumu County are engaged in child labour. About 3 out of 5 (62 per cent) of the children age 2-14 years were subjected to at least one form of violent discipline method by their mothers/caretakers in the one month prior to the survey.

About 42 per cent of women aged 15-49 years are married before their 18th birthday, and almost a quarter (24 per cent) of the adolescent girls of aged 15-19 years in Kisumu County are currently married or in union. Among married women aged 15-19 years, 22 per cent have partners who are 10 or more years older.

## Female genital mutilation/cutting (FGM/C) and domestic violence

---

About 78 per cent of women aged 15-49 years in Kisumu County have heard about FGM/C and slightly more than 2 per cent have undergone a form of FGM/C. About 1 in every 7 (14 per cent) of women aged 15-49 years believe that the practice of FGM/C should be continued.

## Domestic violence

---

Almost half (49 per cent) the population of women age 15-49 years feel that a husband/partner is justified in beating his wife/partner in various circumstances including 'if she neglects the children' (39 per cent) or 'if she argues with him' (24 per cent).

## HIV and AIDS

---

About all (100 per cent) women in Kisumu County have heard of AIDS but only 56 per cent have comprehensive knowledge of HIV prevention methods and transmission.

Knowledge of mother-to-child transmission of HIV is near universal (94 per cent). However, less than half (42 per cent) know of three main ways of HIV transmission.

Stigma and discrimination are still fairly high in Kisumu County as only 19 per cent of women expressed accepting attitudes towards people living with HIV according to all four indicators namely: would care for family member sick with AIDS; would buy fresh vegetables from a vendor who was HIV positive; thinks that a female teacher who is

HIV positive should be allowed to teach in school; and would not want to keep HIV status of a family member a secret.

Although knowledge of a place for HIV testing is nearly universal (95 per cent), only 55 per cent of women have ever been tested. Whilst 82 per cent of the women who gave birth in the last two years preceding the survey received HIV counselling during antenatal care, 81 per cent were offered a HIV test and tested for HIV.

Almost half (48 per cent) of young women aged 15-24 years who have never been married have had sex while almost one out of five (19 per cent) had sex before age 15. Eighteen per cent of young women aged 15-24 years had sex with a man 10 or more years older in the year preceding the survey.

About 2 per cent of women reported having sex with more than one partner in the year preceding the survey. Moreover, about 2 per cent of young women aged 15-24 years had sex with a non-marital, non-cohabiting partner during the same period.

## Orphans and vulnerable children

---

Sixteen per cent of children aged below 18 years are not living with a biological parent. For about 1 in 5 (20 per cent) of children below age 18 in Kisumu County, one or both parents is dead. Seven per cent of children aged 10-14 years have lost both parents. Only 92 per cent of children aged 10-14 years who have lost both parents are currently attending school compared to 99 per cent of non-orphans (orphans to non-orphans school attendance ratio is 0.93).

# Summary Table of Findings

Multiple Indicator Cluster Surveys (MICS) and Millennium Development Goals (MDG) Indicators, Kisumu County, 2011

Topic	MICS4 Indicator Number	MDG Indicator Number	Indicator	Value and Units
<b>SAMPLE</b>				
Households			Households interviewed	1119
Women			Number of women interview	926
Children			Number of children under-5 years with completed information	765
<b>CHILD MORTALITY</b>				
Child mortality	1.1	4.1	Under-five mortality rate	105 per thousand
	1.2	4.2	Infant mortality rate	75 per thousand
	1.3		Neonatal mortality rate	23 per thousand
	1.4		Post neonatal mortality rate	52 per thousand
	1.5		Child mortality rate	33 per thousand live births surviving up to 12 months of age
<b>NUTRITION</b>				
Nutritional status		1.8	Underweight prevalence	
	2.1a		Moderate and Severe (- 2 SD)	14.9 per cent
	2.1b		Severe (- 3 SD)	2.4 per cent
			Stunting prevalence	
	2.2a		Moderate and Severe (- 2 SD)	23.7 per cent
	2.2b		Severe (- 3 SD)	9.4 per cent
			Wasting prevalence	
	2.3a		Moderate and Severe (- 2 SD)	4.1 per cent
	2.3b		Severe (- 3 SD)	0.5 per cent
Breastfeeding and infant feeding	2.4		Children ever breastfed	97.1 per cent
	2.5		Early initiation of breastfeeding	43.1 per cent
	2.6		Exclusive breastfeeding under 6 months	38.5 per cent
	2.7		Continued breastfeeding at 1 year	83.1 per cent
	2.8		Continued breastfeeding at 2 years	(39.7) per cent
	2.9		Predominant breastfeeding under 6 months	58.1 per cent
	2.10		Duration of breastfeeding	21 months
	2.11		Bottle feeding	11.8 per cent
	2.12		Introduction of solid, semi-solid or soft foods	(20.5) per cent
	2.13		Minimum meal frequency	17.6 per cent
	2.14		Age-appropriate breastfeeding	41.7 per cent

Topic	MICS4 Indicator Number	MDG Indicator Number	Indicator	Value and Units
	2.15		Milk feeding frequency for non-breastfed children	13.5 per cent
Salt iodization	2.16		Iodized salt consumption	90.3 per cent
Vitamin A	2.17		Vitamin A supplementation (children under age 5)	43.6 per cent
Low birth weight	2.18		Low-birthweight infants	6.4 per cent
	2.19		Infants weighed at birth	71.5 per cent
<b>CHILD HEALTH</b>				
Vaccinations	3.1		Tuberculosis immunization coverage	99.3 per cent
	3.2		Polio immunization coverage	77.3 per cent
	3.3		Immunization coverage for diphtheria, pertussis and tetanus (DPT)	86.6per cent
	3.4	4.3	Measles immunization coverage	89.9 per cent
	3.6		Yellow fever immunization coverage	83.4 per cent
Tetanus toxoid	3.7		Neonatal tetanus protection	64.5 per cent
Care of illness	3.8		Oral rehydration therapy with continued feeding	37.8 per cent
	3.9		Care seeking for suspected pneumonia	51.5 per cent
	3.10		Antibiotic treatment of suspected pneumonia	63.0 per cent
Solid fuel use	3.11		Solid fuels	91.2 per cent
Malaria	3.12		Household availability of insecticide-treated nets (ITNs)	88.9 per cent
	3.13		Households protected by a vector control method	92.5 per cent
	3.14		Children under age 5 sleeping under any mosquito net	83.6 per cent
	3.15	6.7	Children under age 5 sleeping under insecticide-treated nets (ITNs)	77.8 per cent
	3.17		Antimalarial treatment of children under 5 the same or next day	36.7 per cent
	3.18	6.8	Antimalarial treatment of children under age 5	51.7 per cent
	3.19		Pregnant women sleeping under insecticide-treated nets (ITNs)	82.6 per cent
	3.20		Intermittent preventive treatment for malaria	18.5 per cent
<b>WATER AND SANITATION</b>				
Water and sanitation	4.1	7.8	Use of improved drinking water sources	48.4 per cent
	4.2		Water treatment	71.1 per cent
	4.3	7.9	Use of improved sanitation facilities	25.0 per cent
	4.4		Safe disposal of child's faeces	78.3 per cent
	4.5		Place for handwashing	68.5 per cent
	4.6		Availability of soap	93.4 Per cent

Topic	MICS4 Indicator Number	MDG Indicator Number	Indicator	Value and Units
<b>REPRODUCTIVE HEALTH</b>				
Contraception and unmet need	5.1	5.4	Adolescent birth rate	199 per 1,000
	5.2		Early childbearing	39.9 per cent
	5.3	5.3	Contraceptive prevalence rate	44.4 Per cent
Maternal and new-born health		5.5	Antenatal care coverage	
	5.5a		At least once by skilled personnel	95.1 per cent
	5.5b		At least four times by any provider	52.3 per cent
	5.6		Content of antenatal care	75.1 per cent
	5.7	5.2	Skilled attendant at delivery	57.7 per cent
	5.8		Institutional deliveries	55.5 per cent
	5.9		Caesarean section	6.6 per cent
<b>CHILD DEVELOPMENT</b>				
Child development	6.1		Support for learning	30.9 per cent
	6.2		Father's support for learning	28.4 per cent
	6.3		Learning materials: children's books	6.4 per cent
	6.4		Learning materials: playthings	61.9 per cent
	6.5		Inadequate care	41.9 per cent
	6.6		Early child development index	41.6 per cent
	6.7		Attendance to early childhood education	53.0 per cent
<b>EDUCATION</b>				
Literacy and education	7.1	2.3	Literacy rate among young women	90.2 per cent
	7.2		School readiness	73.9 per cent
	7.3		Net intake rate in primary education	24.9 per cent
	7.4	2.1	Primary school net attendance ratio (adjusted)	80.8 per cent
	7.5		Secondary school net attendance ratio(adjusted)	27.1per cent
	7.6	2.2	Children reaching last grade of primary	91.3per cent
	7.7		Primary completion rate	87.9 per cent
	7.8		Transition rate to secondary school	67.3per cent
	7.9		Gender parity index (primary school)	1.09
	7.10		Gender parity index (secondary school)	0.90
<b>CHILD PROTECTION</b>				
Birth registration	8.1		Birth registration	53.4 per cent
Child labour	8.2		Child labour	45.4 per cent
	8.3		School attendance among child labourers	96.5per cent
	8.4		Child labour among students	45.7 per cent
Child discipline	8.5		Violent discipline	61.9 per cent

Topic	MICS4 Indicator Number	MDG Indicator Number	Indicator	Value and Units
Early marriage and polygyny	8.6		Marriage before age 15	12.3 per cent
	8.7		Marriage before age 18	41.6per cent
	8.8		Young women age 15-19 currently married or in union	23.6per cent
	8.9		Polygyny	0.0 per cent
			Spousal age difference	
	8.10b		Women age 20-24	24.7per cent
Female genital mutilation/cutting	8.11		Approval for female genital mutilation/cutting (FGM/C)	14.4per cent
	8.12		Prevalence of female genital mutilation/cutting (FGM/C) among women	2.2per cent
Domestic violence	8.14		Attitudes towards domestic violence	48.6 per cent
<b>HIV/AIDS, SEXUAL BEHAVIOUR, AND ORPHANED AND VULNERABLE CHILDREN</b>				
HIV/AIDS knowledge and attitudes	9.1		Comprehensive knowledge about HIV prevention	55.8 per cent
	9.2	6.3	Comprehensive knowledge about HIV prevention among young people	51.5 per cent
	9.3		Knowledge of mother-to-child transmission of HIV	41.9 per cent
	9.4		Accepting attitude towards people living with HIV	18.8 per cent
	9.5		Women who know where to be tested for HIV	95.5 per cent
	9.7		Sexually active young women who have been tested for HIV and know the results	37.8 per cent
	9.8		HIV counselling during antenatal care	83.2per cent
	9.9		HIV testing during antenatal care	81.1 per cent
Sexual behaviour	9.10		Young women who have never had sex	47.9 per cent
	9.11		Sex before age 15 among young women	18.9 per cent
	9.12		Age-mixing among sexual partners	18.0 per cent
	9.13		Sex with multiple partners	2.4 per cent
	9.15		Sex with non-regular partners	2.3 per cent
Orphaned children	9.17		Children's living arrangements	15.5 per cent
	9.18		Prevalence of children with at least one parent dead	19.8 per cent
	9.19	6.4	School attendance of orphans	91.5 per cent
	9.20	6.4	School attendance of non-orphans	98.8 per cent

# I. Introduction

---

## Background

This report is based on the Kisumu Multiple Indicator Cluster Survey, conducted in 2011 by the KNBS and UNICEF. The survey provides valuable information on the situation of children and women in Kisumu County, and was based on the need to monitor progress towards the goals and targets emanating from recent international agreements: the Millennium Declaration, adopted by all 191 United Nations Member States in September 2000, and the Plan of Action of A World Fit For Children, adopted by 189 Member States at the United Nations Special Session on Children in May 2002. Both of these commitments build upon promises made by the international community at the 1990 World Summit for Children and are in line with Kenya's Vision 2030 blueprint which aims to transform the country into a middle income country by 2030.

In signing these international agreements, governments committed themselves to improving conditions for their children and to monitoring progress towards this end. UNICEF was assigned a supporting role in this task (see table below).

### A Commitment to Action: National and International Reporting Responsibilities

The governments that signed the Millennium Declaration and the World Fit for Children Declaration and Plan of Action of a World Fit For Children also committed themselves to monitoring progress towards the goals and objectives they contained:

"We will monitor regularly at the national level and, where appropriate, at the regional level and assess progress towards the goals and targets of the present Plan of Action at the national, regional and global levels. Accordingly, we will strengthen our national statistical capacity to collect, analyse and disaggregate data, including by sex, age and other relevant factors that may lead to disparities, and support a wide range of child-focused research. We will enhance international cooperation to support statistical capacity-building efforts and build community capacity for monitoring, assessment and planning." (**A World Fit for Children**, paragraph 60)

"...We will conduct periodic reviews at the national and subnational levels of progress in order to address obstacles more effectively and accelerate actions...." (**A World Fit for Children**, paragraph 61)

The Plan of Action (paragraph 61) also calls for the specific involvement of UNICEF in the preparation of periodic progress reports:

"... As the world's lead agency for children, the United Nations Children's Fund is requested to continue to prepare and disseminate, in close collaboration with Governments, relevant funds, programmes and the specialized agencies of the United Nations system, and all other relevant actors, as appropriate, information on the progress made in the implementation of the Declaration and the Plan of Action."

Similarly, the **Millennium Declaration** (paragraph 31) calls for periodic reporting on progress:

"...We request the General Assembly to review on a regular basis the progress made in implementing the provisions of this Declaration, and ask the Secretary-General to issue periodic reports for consideration by the General Assembly and as a basis for further action."

Kenya is committed to improving the welfare of its people particularly women and children who are the most vulnerable to social-economic hardships. With regards to children, the Government of Kenya (GOK) formulated the National Plan of Action (NPA) for children in 1992 soon after the World Summit for Children (WSC) which was held in 1990. The main objective of this plan was to identify issues affecting children and the strategies to address them.

While adequate monitoring and evaluation of programmes is vital for tracking the country's progress towards various goals and targets, this requires a wide range of data. Moreover, as Kenya transitions from a central to a devolved governance structure in 2013, county specific MICS data will be required to appraise the performance of various domestic initiatives such as The Poverty Reduction Strategy (PRS), Economic Recovery Strategy (ERS) and the 2005-2010 Kenya Education Sector Support Programme (KESSP). The MICS data would also help to monitor overall progress towards the attainment of international targets set by the 2015 Millennium Development Goals (MDGS), the World Fit for Children, the UNICEF Country Programme, UN Development Assistance Framework, the Convention on the Rights of the Child and the Convention on the Elimination of All Forms of Discrimination against Women.

The GOK/UNICEF 2009-2013 Country Programme has a significant focus on production of high quality and sufficiently disaggregated data for effective child friendly policy formulation, equity focused resource allocation, programme implementation as well as monitoring and evaluation. Towards this end, this report summarizes the findings of the 2011 MICS in Kisumu County.

## Survey Objectives

The 2011 Kisumu Multiple Indicator Cluster Survey has as its primary objectives:

- To provide up-to-date information for assessing the situation of children and women in Kisumu County;
- To furnish data needed for monitoring progress toward goals established in the Millennium Declaration and other internationally agreed upon goals, as a basis for future action;
- To contribute to the improvement of data and monitoring systems in Kisumu County and to strengthen technical expertise in the design, implementation, and analysis of such systems.
- To generate data on the situation of children and women, including the identification of vulnerable groups and of disparities in order to inform policies and interventions

## II. Sample and Survey Methodology

---

### Sample Design

The sample for the Kisumu Multiple Indicator Cluster Survey (MICS) was designed to provide estimates for a large number of indicators on the situation of children and women at county level, for urban and rural area. The urban and rural areas within Kisumu were identified as the main sampling strata and the sample was selected in two stages. Therefore, to attain the desired sample size, a two-stage stratified sampling design was applied. The primary sampling units (PSUs) for the survey were the recently created enumeration areas (EAs) based on the 2009 Kenya Population and Housing Census while the households were the ultimate units. Within each stratum, a specified number of census enumeration areas were selected systematically according to the probability proportional to size (PPS) sampling method. After a household listing was carried out within the selected enumeration areas, a systematic sample of 25 households was drawn in each sample enumeration area. In total there were 50 enumeration areas (clusters). The sample was stratified by regional, urban and rural areas, and is not self-weighting. For reporting county level results, sample weights are used. A more detailed description of the sample design can be found in Appendix A.

### Questionnaires

Three sets of questionnaires were used in the survey: 1) a household questionnaire which was used to collect information on all *de jure* household members (usual residents), the household, and the dwelling; 2) a women's questionnaire administered in each household to all women aged 15-49 years; and 3) an under-5 questionnaire, administered to mothers or caretakers for all children under 5 living in the household. The questionnaires included the following modules:

The Household Questionnaire included the following modules:

- Household Listing Form
- Education
- Water and Sanitation
- Household Characteristics
- Insecticide Treated Nets
- Indoor Residual Spraying
- Child Labour
- Child Discipline
- Handwashing
- Salt Iodization
- Orphaned and vulnerable children
- Disability

The Questionnaire for Individual Women was administered to all women aged 15-49 years living in the households, and included the following modules:

- Women's Background
- Child Mortality
- Planning of the last pregnancy
- Maternal and Newborn Health

- Illness Symptoms
- Contraception
- Female Genital Mutilation/Cutting
- Attitudes Towards Domestic Violence
- Marriage/Union
- Sexual Behaviour
- HIV/AIDS
- Birth History
- Tetanus Toxoid

The Questionnaire for Children under Five was administered to mothers or caretakers of children under 5 years of age<sup>1</sup> living in the households. Normally, the questionnaire was administered to mothers of under-5 children; in cases where the mother was not listed in the household roster, a primary caretaker for the child was identified and interviewed. The questionnaire included the following modules:

- Age
- Birth Registration
- Early Childhood Development
- Breastfeeding
- Care of Illness
- Malaria
- Immunization
- Anthropometry
- Vitamin A

The questionnaires are based on the MICS4 model questionnaire<sup>2</sup>. From the MICS4 model English version, the questionnaires were translated into Swahili and Luo which are the commonly spoken languages in Kisumu County. A copy of the MICS questionnaires that were used is provided in Appendix F.

In addition to the administration of questionnaires, fieldwork teams tested the salt used for cooking in the households for iodine content, observed the place for handwashing and measured the weights and heights of children age under 5 years. Details and findings of these measurements are provided in the respective sections of the report.

## Training and Fieldwork

Training for the fieldwork was conducted for 19 days in August/September, 2011. Training included lectures on interviewing techniques and the contents of the questionnaires, and mock interviews between trainees to gain practice in asking questions. Towards the end of the training period, trainees spent 2 days in practice interviewing in Kisumu County within clusters that were not sampled for the main survey exercise.

The data were collected by 12 teams; each comprised of 5 interviewers, one driver, one editor, one measurer and a supervisor. Fieldwork began in October 2011 and concluded in December 2011.

1 The terms “children under 5”, “children age 0-4 years”, and “children aged 0-59 months” are used interchangeably in this report.

2 The model MICS4 questionnaires can be found at [www.childinfo.org](http://www.childinfo.org)

## Data Processing

Data were entered using the CPro software. The data were entered on 43 micro-computers and carried out by 23 data entry operators and 4 data entry supervisors. In order to ensure quality control, all questionnaires were double entered and internal consistency checks were performed. Procedures and standard programs developed under the global MICS4 programme and adapted to the Kisumu County questionnaire were used throughout. Data processing began simultaneously with data collection in October 2011 and was completed in January 2012. Data were analysed using the Statistical Package for Social Sciences (SPSS) software program, Version 18, and the model syntax and tabulation plans developed by UNICEF were used for this purpose.

### III. Sample Coverage and the Characteristics of Households and Respondents

#### Sample Coverage

Of the 1250 households selected for the sample, 1154 were found to be occupied. Of these, 1119 were successfully interviewed yielding a household response rate of 97 per cent. In the interviewed households, 1033 women (age 15-49 years) were eligible. Of these, 926 were successfully interviewed, yielding a response rate of 89.6 per cent within interviewed households. In addition, 771 children under age five were listed in the household questionnaire. Questionnaires were completed for 765 of these children, which corresponds to a response rate of 99.2 per cent within interviewed households. Overall response rates of 86.9 and 96.2 are calculated for the women's and under-5 children's interviews respectively (Table HH.1)

**Table HH.1: Results of household and individual interviews**

Number of households, women, and children under 5 by results of the interviews, and household, women's and under-5's response rates, Kisumu County, 2011	
<b>Households</b>	
Sampled	1250
Occupied	1154
Interviewed	1119
Household response rate	97.0
<b>Women</b>	
Eligible	1033
Interviewed	926
Women's response rate	89.6
Women's overall response rate	86.9
<b>Children under 5</b>	
Eligible	771
Mothers/caretakers interviewed	765
Under-5's response rate	99.2
Under-5's overall response rate	96.2

#### Characteristics of Households

The weighted age and sex distribution of survey population is provided in Table HH.2. The distribution is also used to produce the population pyramid in Figure HH.1. In the 1154 households successfully interviewed in the survey, 5260 household members were listed. Of these, 2607 were males, and 2653 were females. The age distribution from Table HH.2 shows that 45 per cent of the population in the sampled households is below 15 years of age, 52 per cent are aged between 15-64 years and 3 per cent are aged above 65 years. The child population aged between 0-17 years is 52 per cent, highlighting a high dependency burden in Kisumu County.

**Table HH.2: Household age distribution by sex**

Percentage and frequency distribution of the household population by five-year age groups, dependency age groups, and by child (age 0-17 years) and adult populations (age 18 or more), by sex, Kisumu County, 2011							
		Males		Females		Total	
		Number	Per cent	Number	Per cent	Number	Per cent
<b>Age</b>	0-4	439	16.8	427	16.1	866	16.5
	5-9	372	14.3	397	15.0	770	14.6
	10-14	365	14.0	354	13.3	719	13.7
	15-19	314	12.0	264	10.0	578	11.0

() Based on 25-49 unweighted cases. * Not shown, based on less than 25 unweighted cases.							

**Figure HH.1: Age and sex distribution of household population, Kisumu County, 2011**

Table HH.3 - HH.5 provide basic information on the households, female respondents age 15-49, and children under-5 by presenting the un-weighted, as well as the weighted numbers. Information on the basic characteristics of households, women and children under-5 interviewed in the survey is essential for the interpretation of findings presented later in the report and can also provide an indication of the representativeness of the survey. The remaining tables in this report are presented only with weighted numbers. See Appendix A for more details about the weighting.

Table HH.3 provides basic background information on the households. Within households, the sex of the household head, residence, number of household members, and education of household head of the household head are shown in the table. These background characteristics are used in subsequent tables in this report; the figures in the table are also intended to show the numbers of observations by major categories of analysis in the report. The weighted and unweighted numbers of households are equal, since sample weights were normalized (See Appendix A). The table also shows the proportions of households with at least one child under 18, at least one child under 5, and at least one eligible woman age 15-49. The table also shows the weighted average household size estimated by the survey.

In Kisumu County, about 34 per cent of the residents live in the urban areas. The mean household size is 4.1 persons. About 32 per cent of the households are reportedly headed by females and approximately 46 per cent of the households have at least one child below 5 years of age. About 75 per cent of the households have at least one child below 18 years of age and 71 per cent have at least one female in the reproductive age group 15-49 years. About 25 per cent of the household heads have no education, 48 per cent have attained primary while 27 per cent have attained secondary level education.

**Table HH.3: Household composition**

Percentage and frequency distribution of households by selected characteristics, Kisumu County, 2011			
	Weighted per cent	Number of households	
		Weighted	Unweighted
Sex of household head			
Male	68.4	862	767
Female	31.6	398	352
Residence

Total	100	1261	1119
Households with at least			
One child age 0-4 years	46.4	1261	1119
One child age 0-17 years	74.7	1261	1119
One woman age 15-49 years	70.5	1261	1119
Mean household size	4.1	1261	1119

### Characteristics of Female Respondents 15-49 Years of Age and Children Under-5

Tables HH.4 and HH.5 provide information on the background characteristics of female respondents aged 15-49 years and of children under age 5. In both tables, the total numbers of weighted and unweighted observations are equal, since sample weights have been normalized (standardized). In addition to providing useful information on the background characteristics of women and children, the tables are also intended to show the numbers of observations in each background category. These categories are used in the subsequent tabulations of this report.

**Table HH.4: Women's background characteristics**

Percentage and frequency distribution of women age 15-49 years by selected background characteristics, Kisumu County, 2011				
		Weighted per cent	Number of women	
			Weighted	Unweighted
Area	Urban	36.5	386	323
	Rural	63.5	671	603
Age	15-19	18.9	199	175
	20-24	21.3	226	197
	25-29	20.6	218	193
	30-34	11.1	118	104
	35-39	10.6	112	99
	40-44	9.7	102	88
	45-49	7.8	82	70
Marital/Union status	Currently married/in union	65.6	694	608
	Widowed	7.8	83	72
	Divorced	0.7	8	7
	Separated	3.5	38	32
	Never married/in union	22.3	235	207
Motherhood status	Ever gave birth	81.1	858	752
	Never gave birth	18.9	200	174
Births in last two years	Had a birth in last two years	30.1	318	277
	Had no birth in last two years	69.9	740	649
Education	None	12.5	132	109
	Primary	59.5	630	555
	Secondary+	28.0	296	262
Wealth index quintiles	Poorest	8.7	92	80
	Second	12.0	127	111
	Middle	15.8	168	156
	Fourth	24.0	254	231
	Richest	39.4	417	348
Total		100	1057	926

Table HH.4 provides the background characteristics of female respondents 15-49 years of age. The table includes information on the distribution of women according to residence, age, marital status, motherhood status, births in last two years, education<sup>3</sup> and wealth index quintiles<sup>4</sup>.

3 Unless otherwise stated, "education" refers to educational level attended by the respondent throughout this report when it is used as a background variable.

4 Principal components analysis was performed by using information on the ownership of consumer goods, dwelling characteristics, water and sanitation, and other characteristics that are related to the household's wealth to assign weights (factor scores) to each of the household assets. Each household was then assigned a wealth score based on these weights and the assets owned by that household. The survey household population was then ranked according to the wealth score of the household they are living in, and was finally divided into 5 equal parts (quintiles) from lowest (poorest) to highest (richest). The assets used in these calculations were as follows: source of drinking water, type of sanitation, persons per sleeping room, type of floor, roof, wall, cooking fuel; possession of electricity, radio, black and white Tv, colorTv, mobile3 phone, non-mobile phone, fridge, blender, water heater, washing machine, computer, internet, watch, bicycle, car or truck, motorcycle, boat, boat with motor, ownership of dwelling unit, land, cattle, cows, goats, sheep, chicken, horse or donkey, sewing machine, air conditioner, VCR or DVD). The wealth index is assumed to capture the underlying long-term wealth through information on the household assets, and is intended to produce a ranking of households by wealth, from poorest to richest. The wealth index does not provide information on absolute poverty, current income or expenditure levels. The wealth scores calculated are applicable for only the particular data set they are based on. Further information on the construction of the wealth index can be found in Filmer, D. and Pritchett, L., 2001. "Estimating wealth effects without expenditure data – or tears: An application to educational enrolments in states of India". *Demography* 38(1): 115-132. Gwatkin, D.R., Rutstein, S., Johnson, K., Pande, R. and Wagstaff, A., 2000. *Socio-Economic Differences in Health, Nutrition, and Population*. HNP/Poverty Thematic Group, Washington, DC: World Bank. Rutstein, S.O. and Johnson, K., 2004. *The DHS Wealth Index*. DHS Comparative Reports No. 6. Calverton, Maryland: ORC Macro

In Kisumu County, the highest proportion of women aged 15-49 years was in the age category of 20 to 29 years (42 per cent). About 66 per cent of the women aged 15-49 years are currently married whilst 22 per cent reported never having been married or in a union. Eighty one per cent of the women reported having given birth, while 19 per cent had never given birth. Seventy per cent of women had not given birth in the two years preceding the survey. The majority of women had attained primary education (60 per cent) but only 28 per cent had attained secondary level education. About 39 per cent of the women were from households in the richest wealth quintile, while 9 per cent came from households in the poorest wealth index households.

Some background characteristics of children under 5 are presented in Table HH.5. These include the distribution of children by several attributes: sex, residence, age, mother's or caretaker's education, and wealth index. The results show that the proportion of male to female children aged 0-4 years is comparable with each accounting for 50 per cent. About 10 per cent of children aged below five years are in the 0-5 month age group, about an equal proportion of children are in the 6-11 month category. The largest proportion of the children was in the middle age categories of 12 to 47 months which corresponds to 57 per cent of the sample. Sixty seven per cent of children have mothers who have attained primary level education, while twenty two per cent have mothers who have attained at least secondary education. The distribution of children below five years by wealth index shows that 13 per cent come from households in the lowest income category while 31 per cent are from households in the highest income category.

* Mother's education refers to educational attainment of mothers and caretakers of children under 5.				

## IV. Child Mortality

One of the overarching goals of the Millennium Development Goals (MDGs) is the reduction of infant and under-five mortality. Specifically, the MDGs call for reduction in under-five mortality by two-thirds between 1990 and 2015. Monitoring progress towards this goal is an important but difficult objective. Measuring childhood mortality may seem easy, but attempts using direct questions, such as “Has anyone in this household died in the last year?” give inaccurate results.

The Kisumu County Multiple Indicator Cluster Survey utilised direct measures of child mortality from birth histories which is one of the best ways of obtaining this information. The birth history obtained from women aged 15–49 years includes number of children ever born and living by sex, and date of birth of each child born. If the child is not alive at the time of the survey, information on age of the child at the time of death is also obtained. This method is being used by the Demographic and Health Surveys (DHS) worldwide including the Kenya Demographic and Health Survey (KDHS). This allows us to compare the mortality rates obtained by MICS with those of KDHS.

The Infant Mortality Rate (IMR) is the probability of dying before the first birthday. The Under-five Mortality Rate (U5MR) is the probability of dying before the fifth birthday. The neonatal mortality rate is the probability of dying before one month of life. Post neonatal mortality rate is the probability of dying between one month and one year of life. The child mortality rate refers to probability of dying between one and five years of life. All mortality rates mentioned above are expressed per 1,000 live births, except for the child mortality rate, which is expressed per 1,000 children surviving up to 12 months of age.

Though direct estimates of mortality obtained from birth histories are the best, the quality of these mortality estimates depend on the completeness of information obtained in the birth histories. In many cases women tend to avoid reporting their dead children and this tends to under estimate the mortality levels.

Table CM.1 provides estimates of early childhood mortality for the ten year periods preceding the MICS survey. For the ten years immediately preceding the survey, the infant mortality rate is estimated at 75 deaths per 1000 live births, while the probability of dying under age 5 (U5MR) is around 105 deaths per 1000 live births. This implies that about 1 in every 13 children born in Kisumu County dies before their first birthday, while about 1 in every 10 does not survive to age five. The estimated neonatal mortality rate is 23 per thousand live births while the post-neonatal mortality rate is 52 per thousand live births for the five years immediately preceding the MICS survey. This shows that almost a third of infant deaths in Kisumu County occur during the first month of life. The estimated child mortality rate is 33 deaths per 1000 children surviving to the first for the ten-year period preceding the survey. Table CM.1 also shows that over the past 20 years there has been a general decline in childhood mortality.

**Table CM.1: Early childhood mortality rates**

Neonatal, post-neonatal, Infant, child and under-five mortality rates for ten year periods preceding the survey, Kisumu County, 2011					
Years preceding the survey	Neonatal mortality rate [1]	Post-neonatal mortality rate [2]	Infant mortality rate [3]	Child mortality rate [4]	Under-five mortality rate [5]
0-9	22.8	51.8	74.6	33.4	105.4
10-19	30.3	69.6	99.9	69.8	162.7
[1] MICS indicator 1.3					
[2] MICS indicator 1.4					
[3] MICS indicator 1.2; MDG indicator 4.2					
[4] MICS indicator 1.5					
[5] MICS indicator 1.1; MDG indicator 4.1					
Post-neonatal mortality rates are computed as the difference between the infant and neonatal mortality rates					

## V. Nutrition

---

### Nutritional Status

Children's nutritional status is a reflection of their overall health. When children have access to an adequate food supply, are not exposed to repeated illness, and are well cared for, they reach their growth potential and are considered well nourished.

Malnutrition is associated with more than half of all child deaths worldwide. Undernourished children are more likely to die from common childhood ailments, and those who survive have recurring sicknesses and faltering growth. Three-quarters of the children who die from causes related to malnutrition are only mildly or moderately malnourished – showing no outward sign of their vulnerability. The Millennium Development target is to reduce the proportion of people who suffer from hunger by half between 1990 and 2015. A reduction in the prevalence of malnutrition will also assist in the goal to reduce child mortality.

In a well-nourished population, there is a reference distribution of height and weight for children under age five. Under-nourishment in a population can be gauged by comparing children to a reference population. The reference population used in this report is based on new WHO growth standards<sup>5</sup>. Each of the three nutritional status indicators can be expressed in standard deviation units (z-scores) from the median of the reference population.

*Weight-for-age* is a measure of both acute and chronic malnutrition. Children whose weight-for-age is more than two standard deviations below the median of the reference population are considered *moderately or severely underweight* while those whose weight-for-age is more than three standard deviations below the median are classified as *severely underweight*.

Height-for-age is a measure of linear growth. Children whose height-for-age is more than two standard deviations below the median of the reference population are considered short for their age and are classified as *moderately or severely stunted*. Those whose height-for-age is more than three standard deviations below the median are classified as *severely stunted*. Stunting is a reflection of chronic malnutrition as a result of failure to receive adequate nutrition over a long period or recurrent or chronic illness.

Finally, children whose *weight-for-height* is more than two standard deviations below the median of the reference population are classified as *moderately or severely wasted*, while those who fall more than three standard deviations below the median are classified as *severely wasted*. Wasting is usually the result of a recent nutritional deficiency. The indicator may exhibit significant seasonal shifts associated with changes in the availability of food or disease prevalence.

In MICS, weights and heights of all children under 5 years of age were measured using anthropometric equipment recommended by UNICEF ([www.childinfo.org](http://www.childinfo.org)). Findings in this section are based on the results of these measurements.

Table NU.1 shows percentages of children classified into each of these categories, based on the anthropometric measurements that were taken during fieldwork. Additionally, the table includes the percentage of children who are overweight, which takes into account those children whose weight for height is above 2 standard deviations from the median of the reference population, and the mean z-scores for all three anthropometric indicators.

---

Notes: The first two columns for each anthropometric indicator refer to children whose z-scores for the anthropometric indicator (i.e. the exact number of standard deviations from the median) fall below -2 standard deviations (moderately and severely underweight, stunted, or wasted) and -3 standard deviations (severely underweight, stunted, or wasted) from the median of the WHO Child Growth Standards for the same anthropometric indicator. The table also includes mean z-scores for each anthropometric indicator, and the percentage of children who are overweight, which takes into account those children whose weight for height is above 2 standard deviations from the median of the WHO Child Growth Standards.													
The per cent 'below -2 standard deviations' includes those who fall -3 standard deviations below the median.													
Indices used in this table are not comparable to those based on the NCHS/CDC/WHO reference. For the nutritional status table based on the NCHS/CDC/WHO, see the tables in the appendix.													

Children whose full birth date (month and year) were not obtained (this should normally not exist in MICS surveys), and children whose measurements are outside a plausible range are excluded from Table NU.1. Children are excluded from one or more of the anthropometric indicators when their weights and heights have not been measured, whichever is applicable. For example if a child has been weighed but his/her height has not been measured, the child is included in underweight calculations, but not in the calculations for stunting and wasting. Percentages of children by age and reasons for exclusion are shown in the data quality tables DQ.6 and DQ.7. Overall all children in Kisumu County had either their month or year of birth taken. About 98 per cent of children had their month of birth taken whilst an equal proportion had both their weights and heights measured (Table DQ.6). Table DQ.7 shows that due to incomplete dates of birth, implausible measurements, and missing weight and/or height, 2 per cent of children have been excluded from calculations of the weight-for-age indicator, while an equal proportion have been excluded from calculations of the height-for-age and the weight-for-height indicators.

Approximately one in seven (15 per cent ) children under age five in Kisumu County are moderately or severely underweight (below -2SD from the WHO reference mean) whilst over 2 per cent are classified as severely underweight (below -3SD from the WHO reference mean) (Table NU.1). Almost one in four (24 per cent) is moderately or severely stunted or too short for their age whilst about 1 in 10 is severely stunted. About 1 in 25 (4 per cent) is moderately or severely wasted or too thin for their height, whilst an equal proportion are classified as overweight.

The proportions of underweight and stunted children in Kisumu County are generally comparable for males and females. In general, the proportion of children who are underweight is high among those whose mothers are less educated, and the same applies for stunted or wasted.

**Figure NU.1: Percentage of children under age 5 who are underweight, stunted and wasted, Kisumu County, 2011**

The age pattern shows that a higher percentage of children aged 12-23 months are undernourished according to all three indices when compared to children in other age groups (Figure NU.1). This pattern is expected and is related to the age at which many children cease to be breastfed and get exposed to contamination in water, food, and environment. On the other hand, overweight levels are highest for children aged less than 6 months and lowest for children aged 24-35 months.

## **Breastfeeding and Infant and Young Child Feeding**

Breastfeeding for the first few years of life protects children from infection, provides an ideal source of nutrients, and is economical and safe. However, many mothers stop breastfeeding too soon and there are often pressures to switch to infant formula, which can contribute to growth faltering and micronutrient malnutrition, and is unsafe if clean water is not readily available.

WHO/UNICEF have the following feeding recommendations:

- Exclusive breastfeeding for first six months
- Continued breastfeeding for two years or more
- Safe, appropriate and adequate complementary foods beginning at 6 months
- Frequency of complementary feeding: 2 times per day for 6-8 month olds; 3 times per day for 9-11 month olds

It is also recommended that breastfeeding be initiated within one hour of birth.

The indicators related to recommended child feeding practices are as follows:

- Early initiation of breastfeeding (within 1 hour of birth)
- Exclusive breastfeeding rate (< 6 months)
- Predominant breastfeeding (< 6 months)
- Continued breastfeeding rate (at 1 year and at 2 years)
- Duration of breastfeeding
- Age-appropriate breastfeeding (0-23 months)
- Introduction of solid, semi-solid and soft foods (6-8 months)
- Minimum meal frequency (6-23 months)
- Milk feeding frequency for non-breastfeeding children (6-23 months)
- Bottle feeding (0-23 months)

Table NU.2: Initial breastfeeding

Percentage of last-born children in the 2 years preceding the survey who were ever breastfed, percentage who were breastfed within one hour of birth and within one day of birth, Kisumu County, 2011

[1] MICS indicator 2.4				
[2] MICS indicator 2.5				
( ) Based on 25-49 unweighted cases				

Table NU.2 provides the proportion of children born in the last two years who were ever breastfed, those who were first breastfed within one hour and one day of birth. Although a very important step in management of lactation and establishment of a physical and emotional relationship between the baby and the mother, less than half (43 per cent) of babies in Kisumu County are breastfed for the first time within one hour of birth. About 89 per cent of newborns start breastfeeding within one day of birth. The proportion breastfed within one hour of birth is 46 per cent in urban and 41 per cent in rural areas. The proportion breastfed within one hour of birth is also higher amongst children delivered in health facilities (above 45 per cent) than amongst those delivered at home (33 per cent), and amongst those delivered by a skilled attendant (50 per cent) than amongst those delivered by a traditional birth attendant (33 per cent).

**Figure NU.2: Percentage of mothers who started breastfeeding within one hour and within one day of birth, Kisumu County, 2011**

In Table NU.3, breastfeeding status is presented based on the reports of mothers/caretakers of children's consumption of food and fluids in the 24 hours prior to the survey. *Exclusively breastfed* refers to infants who received only breast milk (and vitamins, mineral supplements, or medicine). The table shows exclusive breastfeeding of infants during the first six months of life, as well as continued breastfeeding of children at 12-15 and 20-23 months of age.

**Table NU.3: Breastfeeding**

( ) Based on 25-49 unweighted cases. <i>Titles of indicators on continued breastfeeding at 1 and 2 years reflect approximations of the age ranges covered.</i>							

Exclusive breastfeeding in Kisumu County is not common, with only 39 per cent of children aged less than six months being exclusively breastfed; this level is considerably lower than the recommended level of 100 per cent exclusive breastfeeding. By age 12-15 months, 83 per cent of children are still being breastfed.

Table NU.4 shows the median duration of breastfeeding by selected background characteristics. Among children under age 3, the median duration is approximately 21 months for any breastfeeding, 1 month for exclusive breastfeeding, and 3 months for predominant breastfeeding. The median duration of any breastfeeding is comparable in urban and rural areas, and across wealth quintiles.

**Table NU.4: Duration of breastfeeding**

Median duration of any breastfeeding, exclusive breastfeeding, and predominant breastfeeding among children age 0-35 months, Kisumu County, 2011

[1] MICS indicator 2.10

( ) Based on 25-49 unweighted cases

a) Median duration of any breastfeeding is calculated as the age in months when 50 per cent of children age 0-35 months did not receive breast milk during the previous day. Median durations of exclusive and predominant breastfeeding are calculated the same way

b) Median and mean durations are based on current status. The table is based only on living children at the time of survey.

c) For definitions of exclusive and predominant breastfeeding, see footnotes below Table NU.3.

The adequacy of infant feeding in children less than 24 months is provided in Table NU.5. Different criteria of adequate feeding are used depending on the age of the child. For infants aged 0-5 months, exclusive breastfeeding is considered as adequate feeding, while infants aged 6-23 months are considered to be adequately fed if they are receiving breast milk and solid, semi-solid or soft food. In Kisumu County, only 39 per cent of infants aged 0-5 months are exclusively breast fed, whilst about 43 per cent of those in the 6-23 months age group are adequately fed. Overall, about 42 per cent of children aged 0-23 months are appropriately fed.

In general, a higher proportion (45 per cent) of male children aged 0-23 months are appropriately fed than their female counterparts (39 per cent). The proportion of children aged 6-23 months who are adequately fed is 44 per cent in rural areas and 39 per cent in urban areas.

Amongst children aged 6-23 months, the proportion that is adequately fed is marginally higher amongst those whose mothers have attained secondary level education (49 per cent) than amongst those whose mothers have primary level education (around 41 per cent).

**Table NU.5: Age-appropriate breastfeeding**

Percentage of children age 0-23 months who were appropriately breastfed during the previous day, Kisumu County, 2011						
	Children age 0-5 months		Children age 6-23 months		Children age 0-23 months

Table NU.7 presents the proportion of children age 6-23 months who received semi-solid or soft foods the minimum number of times or more during the previous day according to breastfeeding status (see the note in Table NU.7 for a definition of minimum number of times for different age groups). Among currently breastfeeding children aged 6-23 months, only one in five (20 per cent) are receiving solid, semi-solid and soft foods the minimum number of times, whilst among non-breastfeeding children, only one in ten (10 per cent) are receiving solid, semi-solid and soft foods or milk feeds 4 times or more. Overall, the proportion of children aged 6-23 months receiving solid, semi-solid and soft foods the minimum number of times in Kisumu County is 18 per cent.

**Table NU.7: Minimum meal frequency**

(\*) Not shown, based on less than 25 unweighted cases. ( ) Based on 25-49 unweighted cases.

Note: Among currently breastfeeding children age 6-8 months, minimum meal frequency is defined as children who also received solid, semi-solid or soft foods 2 times or more. Among currently breastfeeding children age 9-23 months, receipt of solid, semi-solid or soft foods at least 3 times constitutes minimum meal frequency. For non-breastfeeding children age 6-23 months, minimum meal frequency is defined as children receiving solid, semi-solid or soft foods, and milk feeds, at least 4 times during the previous day.

The continued practice of bottle-feeding is a concern because of the possible contamination due to unsafe water and lack of hygiene in preparation. Table NU.8 shows that bottle-feeding is still occurring in Kisumu County with 12 per cent of children aged 0-23 months reported to have been fed using a bottle with a nipple. Bottle feeding with a nipple ranges from 14 per cent among children in urban areas to 11 per cent among those from rural areas. Similarly the proportion ranges from 15 per cent among children ages 0-5 months to 8 per cent among those aged 12-23 months.

## Salt Iodization

Iodine Deficiency Disorders (IDD) is the world's leading cause of preventable mental retardation and impaired psychomotor development in young children. In its most extreme form, iodine deficiency causes cretinism. It also increases the risks of stillbirth and miscarriage in pregnant women. Iodine deficiency is most commonly and visibly associated with goitre. IDD takes its greatest toll in impaired mental growth and development, contributing in turn to poor school performance, reduced intellectual ability, and impaired work performance. The international goal is to achieve sustainable elimination of iodine deficiency by 2005. The WHO and UNICEF recommend universal salt iodization as a safe, cost-effective and sustainable strategy to ensure sufficient intake of iodine by all individuals. In line with international recommendations, The Kenya Ministry of Public Health & Sanitation (MOPHS) recommends that all salts meant for human consumption in Kenya be iodized. The indicator is the percentage of households consuming adequately iodized salt (>15 parts per million).

**Table NU.9: Iodized salt consumption**

Percentage distribution of households by consumption of iodized salt, Kisumu County, 2011								
	Percentage of households in which salt was tested	Number of households	Per cent of households with				Total	Number of households in which salt was tested or with no salt
			No salt	Salt test result				
				Not iodized 0 PPM	>0 and <15 PPM	15+ PPM [1]		
Residence

Richest	89.4	450	7.9	0.2	0.9	91.0	100.0	437
Total	88.9	1261	8.6	0.2	1.0	90.3	100.0	1226
[1] MICS indicator 2.16								
Note: Adequately iodized salt is defined as salt that contains at least 15 parts per million of iodine								

In 89 per cent of households, salt used for cooking was analysed for the presence of potassium iodate using salt test kits. Table NU.9 shows that in a small proportion of households (9 per cent), there was no salt available. The proportion of households consuming adequate levels of iodine is high in Kisumu County (90 per cent). Consumption of adequate levels of iodine in salt does not differ greatly by rural and urban areas and across the wealth quintiles (Figure NU.4).

**Figure NU.3: Percentage of households consuming adequately iodized salt, Kisumu County 2011**

## Children's Vitamin A Supplementation

Vitamin A is essential for eye health and proper functioning of the immune system. It is found in foods such as milk, liver, eggs, red and orange fruits, red palm oil and green leafy vegetables, although the amount of vitamin A readily available to the body from these sources varies widely. In developing areas of the world, where vitamin A is largely consumed in the form of fruits and vegetables, daily per capita intake is often insufficient to meet dietary requirements. Inadequate intakes are further compromised by increased requirements for the vitamin as children grow or during periods of illness, as well as by increased losses during common childhood infections. As a result, vitamin A deficiency is quite prevalent in the developing world and particularly in countries with the highest burden of under-five deaths.

The 1990 World Summit for Children set the goal of virtual elimination of vitamin A deficiency and its consequences, including blindness, by the year 2000. This goal was also endorsed at the Policy Conference on Ending Hidden Hunger in 1991, the 1992 International Conference on Nutrition, and the UN General Assembly's Special Session on Children in 2002. The critical role of vitamin A for child health and immune function also makes control of the deficiency a primary component of child survival efforts, and therefore critical to the achievement of the fourth Millennium Development Goal: a two-thirds reduction in under-five mortality by the year 2015.

For countries with vitamin A deficiency problems, current international recommendations call for high-dose vitamin A supplementation every four to six months, targeted to all children between the ages of six to 59 months living in affected areas. Providing young children with two high-dose vitamin A capsules a year is a safe, cost-effective, efficient strategy for eliminating vitamin A deficiency and improving child survival. Giving vitamin A to new mothers who are breastfeeding helps to protect their children during the first months of life, and to replenish the mother's stores of vitamin A, which are depleted during pregnancy and lactation. For countries with vitamin A supplementation programs, the definition of the indicator is the percentage of children aged 6-59 months who are receiving at least one high dose vitamin A supplement in the last six months.

In line with UNICEF/ WHO guidelines, The Kenya Ministry of Public Health and Sanitation (MOPHS) recommends that children aged 6-11 months be given one high dose Vitamin A capsules and that children aged 12-59 months be given a vitamin A capsule every 6 months. In Kenya, Vitamin A capsules are linked to immunization services and are given when the child has contact with these services after six months of age. It is also recommended that mothers take a Vitamin A supplement within eight weeks of giving birth due to increased Vitamin A requirements during pregnancy and lactation.

Within the six months prior to the MICS, 44 per cent of children aged 6-59 months received a high dose Vitamin A supplement (Table NU.10).

The proportion of children receiving vitamin A supplementation is 48 per cent in urban and 42 per cent in rural areas. The proportion of children receiving vitamin A supplementation increases as the education level of the mother increases i.e. 29 per cent amongst children whose mothers are uneducated and 51 per cent amongst those whose mothers have attained secondary level education.

**Table NU.10: Children's vitamin A supplementation**

Per cent distribution of children age 6-59 months by receipt of a high dose vitamin A supplement in the last 6 and 12 months, Kisumu County, 2011

	Fourth	11.6	6.6	52.5	42.0	42.7	176
	Richest	9.0	5.6	53.4	43.6	43.6	227
<b>Total</b>		<b>7.2</b>	<b>4.2</b>	<b>53.3</b>	<b>43.2</b>	<b>43.6</b>	<b>777</b>
1 MICS indicator 2.17							

The age pattern of Vitamin A supplementation shows that the proportion receiving supplementation in the last 6 months decreases with age; it is highest in the 6-11 months age group (73 per cent) and lowest in the 48-59 months age group (34 per cent). The proportion of children receiving Vitamin A supplementation is comparable across the levels of the wealth quintiles.

## Low Birth Weight

Weight at birth is a good indicator not only of a mother's health and nutritional status but also the newborn's chances for survival, growth, long-term health and psychosocial development. Children with low birth weight (less than 2,500 grams) are at an increased health risk. Babies who were undernourished in the womb face a greatly increased risk of dying during their early months and years. Those who survive have impaired immune function and increased risk of disease; they are likely to remain undernourished and to have reduced muscle strength throughout their lives, and suffer a higher incidence of diabetes and heart disease in later life. Children born underweight also tend to have a lower IQ and cognitive disabilities, affecting their performance in school and their job opportunities as adults.

In the developing world, low birth weight stems primarily from the mother's poor health and poor nutrition. Three factors have the most impact: the mother's poor nutritional status before conception, short stature (due mostly to under nutrition and infections during her childhood), and poor nutrition during the pregnancy. Inadequate weight gain during pregnancy is particularly important since it accounts for a large proportion of foetal growth retardation. Moreover, diseases such as diarrhoea and malaria, which are common in many developing countries, can significantly impair foetal growth if the mother becomes infected while pregnant.

In the industrialized world, cigarette smoking during pregnancy is the leading cause of low birth weight. In developed and developing countries alike, teenagers who give birth when their own bodies have yet to finish growing are at increased risk of bearing underweight babies.

One of the major challenges in measuring the incidence of low birth weight is the fact that more than half of infants in the developing world are not weighed. In the past, most estimates of low birth weight for developing countries were based on data compiled from health facilities. However, these estimates are biased for most developing countries because the majority of new-borns are not delivered in facilities, and those who are represent only a selected sample of all births.

Because many infants are not weighed at birth and those who are weighed may be a biased sample of all births, the reported birth weights usually cannot be used to estimate the prevalence of low birth weight among all children. Therefore, the percentage of births weighing below 2500 grams is estimated from two items in the questionnaire: the mother's assessment of the child's size at birth (i.e. very small, smaller than average, average, larger than average, very large) and the mother's recall of the child's weight or the weight as recorded on a health card if the child was weighed at birth<sup>6</sup>.

**Table NU.11: Low birth weight infants**

Percentage of last-born children in the 2 years preceding the survey that are estimated to have weighed below 2500 grams at birth and percentage of live births weighed at birth, Kisumu County, 2011

Total	6.4	71.5	318
[1] MICS indicator 2.18			
[2] MICS indicator 2.19			
( ) Based on 25-49 unweighted cases.			

6 For a detailed description of the methodology, see Boerma, J. T., Weinstein, K. I., Rutstein, S.O., and Sommerfelt, A. E. , 1996 *Data on Birth Weight in Developing Countries: Can Surveys Help?* Bulletin of the World Health Organization, 74(2), 209-16.

Overall, 72 per cent of births are weighed at birth and approximately 6 per cent of infants are estimated to have weighed less than 2500 grams at birth (Table NU.11 and Figure NU.5). It is noteworthy that the proportion of children weighed at birth is higher in urban (85 per cent) than rural areas (64per cent). There is no marked variation in the proportion of children born with low birth weight in rural and urban areas, or amongst children whose mothers have attained different levels of education. However, the proportion of children weighed at birth is higher among those from the richest households (84 per cent), compared to 72 and 68 per cent among those from the fourth and middle household wealth quintiles, respectively.

**Figure NU.5: Percentage of infants below 2500g and those weighed at birth, Kisumu County, 2011**

## VI. Child Health

---

### Vaccinations

The Millennium Development Goal (MDG) 4 is to reduce child mortality by two thirds between 1990 and 2015. Immunization plays a key part in this goal. Immunizations have saved the lives of millions of children in the three decades since the launch of the Expanded Programme on Immunization (EPI) in 1974. Worldwide there are still 27 million children overlooked by routine immunization and as a result, vaccine-preventable diseases cause more than 2 million deaths every year.

A World Fit for Children goal is to ensure full immunization of children under the age one year of age at 90 per cent nationally, with at least 80 per cent coverage in every district or equivalent administrative unit.

The Kenya National Expanded Programme on Immunization (KEPI) recommends that a child should receive a BCG vaccination to protect against tuberculosis, three doses of DPT-HeB-Hib (Pentavalent) vaccine to protect against diphtheria, pertussis, tetanus, Hepatitis B and invasive *Hemophilus influenzae* type B disease, four doses of polio vaccine and a single dose of measles vaccine by the age of 9 months. Mothers were asked to provide vaccination cards for children under the age of five. Interviewers copied vaccination information from the cards onto the MICS questionnaire.

The Hepatitis B vaccine is included in the immunization schedule in Kenya as part of the Pentavalent vaccine whilst yellow fever vaccine is recommended (at 9 months) in four districts in Rift Valley Province. Although not on the national immunization schedule, the meningococcal vaccine is also recommended for children between 6 weeks and 1 year. The HiB and Pneumomococcal conjugate (PCV) vaccines were introduced into the national immunization programme in 2011. However data for immunization before 12 months of age for these vaccines was not collected in this MICS survey.

The percentage of children age 12 to 23 months who received each of the vaccinations is shown in Table CH.1. The denominator for the table is children age 12-23 months, therefore only children who were old enough to be fully vaccinated were counted. In the first and second columns, the numerator includes all children who were vaccinated at any time before the survey according to the vaccination card or the mother's report. In the last column, only those who were vaccinated before their first birthday, as recommended, are included. For children without vaccination cards, the proportion of vaccinations given before the first birthday is assumed to be the same as for children with vaccination cards.

Overall, 74 per cent of children had health cards (Table CH.2). If the child did not have a card, the mother was asked to recall whether or not the child had received each of the vaccinations and, for DPT and Polio, how many times. The percentage of children age 12 to 23 months who received each of the vaccinations is shown in Table CH.1. The denominator of the table is comprised of children age 12-23 months so that only children who are old enough to be fully vaccinated are counted. In the first and second columns, the numerator includes all children who were vaccinated at any time before the survey according to the vaccination card or the mother's report. In the last column, only those who were vaccinated before their first birthday, as recommended, are included. For children without vaccination cards, the proportion of vaccinations given before the first birthday is assumed to be the same as for children with vaccination cards.

**Table CH.1: Vaccinations in first year of life**

Percentage of children age 12-23 months immunized against childhood diseases at any time before the survey and before the first birthday, Kisumu County, 2011				
	Vaccinated at any time before the survey according to			Vaccinated by 12 months of age
	Vaccination card	Mother's report	Either	
BCG [1]	73.7	25.6	99.3	99.3
<b>Polio</b>				
At birth	72.4	18.9	91.3	91.3
1	73.7	21.2	94.9	94.9
2	73.0	12.2	85.2	85.2
3 [2]	67.8	11.3	79.1	77.3
<b>DPT</b>				
1	74.3	23.4	97.7	94.8
2	74.3	20.1	94.4	94.4
3 [3]	74.3	13.2	87.5	86.6
Measles [4]	73.4	22.7	96.1	89.9
Yellow fever [5]	74.9	8.5	83.4	83.4
All vaccinations	74.0	0.0	74.0	63.8
No vaccinations	0.0	0.7	0.7	0.7
Number of children age 12-23 months	147	147	147	147
[1] MICS indicator 3.1; [2] MICS indicator 3.2; [3] MICS indicator 3.3 [4] MICS indicator 3.4; MDG indicator 4.3 [5] MICS indicator 3.6 Notes: a) For each antigen, the total number of 12-23 month old children vaccinated before 12 months is calculated, as validated by card or mother's recall. To estimate the number of children without a card who have received vaccine before the first birthday, the proportion of vaccinations given during the first year of life is assumed to be the same as for the proportion of children with a card that received the vaccine before first birthday. b) The use of the 12-23 months age group is based on the assumption that measles is given at 9 months of age. In countries where measles vaccination is given later, an older age group should be used. c) Children receiving all vaccinations (fully immunized children) needs to be determined at the country level, in accordance with the existing vaccination schedule and the vaccinations included in the table should be revised / adapted accordingly.				

There is almost universal coverage of immunisation of BCG (99 per cent), followed by high coverage of the first doses of Polio and DPT amongst children aged 12-23 month by 12 month of age in Kisumu County. For example, while 99 per cent of children have received a BCG vaccination by 12 months of age, 90 per cent have received the measles vaccine, 95 per cent have received first dose of DPT and 91 per cent have received polio vaccine at birth. However, the proportion of children who have received the second and third doses of DPT and Polio drops as show in Table CH.1 and Figure CH.1. For instance, DPT vaccine coverage falls to 87 per cent by the third dose and the third dose of polio vaccine drops to 77 per cent. Due to the lower proportions of children who have received their second and third vaccines, the overall proportion of children who have received all recommended vaccinations by their first birthday is 64 per cent. It is noteworthy that the proportion of children who receive the yellow fever vaccine is lower than for all other vaccines, at 83 per cent of children. Less than 1 per cent of the children in Kisumu County have not received any vaccinations at all.

**Figure CH.1: Percentage of children aged 12-23 months who received the recommended vaccinations by 12 months, Kisumu County, 2011**

Table CH.2 shows vaccination coverage rates among children 12-23 months by background characteristics. The figures indicate children receiving the vaccinations at any time up to the date of the survey, and are based on information from both the vaccination cards and mothers'/caretakers' reports. Overall, about three out of four (74 per cent) of children aged 12-23 months had received all the vaccinations by the time of the survey, with 74 per cent of the children possessing vaccination cards that were seen by an interviewer. The proportion of children who are vaccinated is comparable across male and females for all vaccine types.

**Table CH.2: Vaccinations by background characteristics**

Percentage of women age 15-49 years with a live birth in the last 2 years protected against neonatal tetanus, Kisumu County, 2011													
	Percentage of children who received:										Percentage with vaccination card seen		Number of children age 12-23 months

(\*) Not shown, based on less than 25 unweighted cases. ( ) Based on 25-49 unweighted cases.

Notes:

a) In this table, the calculation is the same as the third column of Table CH.1 (i.e. the child's age at vaccination is not taken into account). Children who were vaccinated at any time before the survey are included in the numerator.

b) Children receiving all vaccinations (fully immunized children) needs to be determined at the country level, in accordance with the existing vaccination schedule. Vaccinations included in the table should be revised/adapted accordingly.

(\*) Not shown, based on less than 25 unweighted cases. ( ) Based on 25-49 unweighted cases.

Notes:

a) In this table, the calculation is the same as the third column of Table CH.1 (i.e. the child's age at vaccination is not taken into account). Children who were vaccinated at any time before the survey are included in the numerator.

b) Children receiving all vaccinations (fully immunized children) needs to be determined at the country level, in accordance with the existing vaccination schedule. Vaccinations included in the table should be revised/adapted accordingly.

## Neonatal Tetanus Protection

One of the MDGs is to reduce by three quarters the maternal mortality ratio, with one strategy to eliminate maternal tetanus. In addition, another goal is to reduce the incidence of neonatal tetanus to less than 1 case of neonatal tetanus per 1000 live births in every district. One of 'A World Fit for Children's goal is to eliminate maternal and neonatal tetanus by 2005.

Prevention of maternal and neonatal tetanus is to assure all pregnant women receive at least two doses of tetanus toxoid vaccine. However, if women have not received two doses of the vaccine during the pregnancy, they (and their new-born) are also considered to be protected if the following conditions are met:

- Received at least two doses of tetanus toxoid vaccine, the last within the prior 3 years;
- Received at least 3 doses, the last within the prior 5 years;
- Received at least 4 doses, the last within 10 years;
- Received at least 5 doses during lifetime.

Table CH.3 shows the status of protection from tetanus for women who have had a live birth within the last 2 years. Overall, 65 per cent of women who have had a live birth in the last 2 years are protected against tetanus. The proportion of women who are protected is 69 per cent in urban areas and 62 per cent in rural areas. Seventy six (76) per cent of women who have attained secondary level education have protection against neonatal tetanus compared to 60 per cent of women with primary level education. Seventy per cent of women who reside in the richest quintile are vaccinated against neonatal tetanus.

**Table CH.3: Neonatal tetanus protection**

Percentage of women age 15-49 years with a live birth in the last 2 years protected against neonatal tetanus, Kisumu County, 2011

## Oral Rehydration Treatment

Diarrhoea is the second leading cause of death among children under five worldwide. Most diarrhoea-related deaths in children are due to dehydration arising from loss of large quantities of water and electrolytes from the body in liquid stools. Management of diarrhoea - either through oral rehydration salts (ORS) or a recommended home fluid (RHF) - can prevent many of these deaths. Preventing dehydration and malnutrition by increasing fluid intake and continuing to feed the child are also important strategies for managing diarrhoea.

The goals are to: 1) reduce death due to diarrhoea among children under five by one half between 2000 and 2010 (A World Fit for Children); and 2) reduce the mortality rate among children under five by two thirds between 1990 and 2015 (Millennium Development Goals). In addition, the 'World Fit for Children' calls for a reduction in the incidence of diarrhoea by 25 per cent.

The indicators are:

- Prevalence of diarrhoea
- Oral rehydration therapy (ORT)
- Home management of diarrhoea
- ORT with continued feeding

In the MICS questionnaire, mothers (or caretakers) were asked to report whether their child had had diarrhoea in the two weeks prior to the survey. If so, the mother was asked a series of questions about what the child had to drink and eat during the episode and whether this was more or less than the child usually ate and drank.

Overall, 18 per cent of children under five years of age had diarrhoea in the two weeks preceding the survey - 20 per cent in urban areas and 17 per cent in rural areas (Table CH.4). Diarrhoea prevalence varies by gender with 21 per cent of male children affected compared to 15 per cent of female children. The peak of diarrhoea prevalence (33 per cent) occurs in the 12-23 months age group. There are no major differences in proportion of children who have had diarrhoea by mother's level of education or across the wealth quintiles due to few observation points.

**Table CH.4: Oral rehydration solutions and recommended homemade fluids**

Percentage of children age 0-59 months with diarrhoea in the last two weeks, and treatment with oral rehydration solutions and recommended homemade fluids, Kisumu County, 2011

Table CH.4 also shows the percentage of children receiving various types of recommended liquids during the episode of diarrhoea. Since mothers were able to name more than one type of liquid, the percentages do not necessarily add to 100. Only about 2 out of 5 children with diarrhoea (40 per cent) receive oral rehydration therapy (ORS) or other recommended homemade fluids. The highest proportion (28 per cent) of children with diarrhoea received fluids from ORS packets or pre-packaged ORS fluids. The proportion of children who receive either sugar and salt solutions or other recommended home-made fluids is 12 per cent. The proportion receiving ORS or other recommended homemade fluids ranges from 42 per cent for boys to 36 per cent for girls, and 45 per cent for rural areas compared to 30 per cent in urban areas. Two out of every five (40 per cent) children who had had diarrhoea received ORS or any recommended homemade fluid (ORT). Figure CH.3 shows the differences between proportion of children who receive (ORT) by gender and area of residence.

**Figure CH.3: Percentage of children under age 5 with diarrhoea who received oral rehydration treatment, Kisumu County, 2011**

Table CH.5 outlines the percentage of children age 0-59 months with diarrhoea in the last two weeks by amount of liquids and food given during their episode of diarrhoea. About a quarter (24 per cent) of children who had diarrhoea were given more to drink and 38 per cent were given about the same or somewhat less to drink. In regards to the amount of food given to these children, 32 per cent were given about the same to eat with an additional (Table CH.5). This is in line with the strategies for managing diarrhoea to prevent dehydration and malnutrition by maintaining and/or increasing fluid and food intake. (Table CH.5). Worryingly, almost two out of every five (37 per cent) of the children are given much less to drink whilst 14 per cent of the children are given nothing to eat and 42 per cent are given much less to eat. For children who had diarrhoea, the decrease in food and fluid intake increases their chances of dehydration and malnutrition.

**Table CH.5: Feeding practices during diarrhoea**

Percentage distribution of children age 0-59 months with diarrhoea in the last two weeks by amount of liquids and food given during episode of diarrhoea, Kisumu County, 2011

) Based on 25-49 unweighted cases														

Table CH.6 provides the proportion of children age 0-59 months with diarrhoea in the last two weeks who received oral rehydration therapy with continued feeding, and the percentage of children with diarrhoea who received other treatments. Overall, 38 per cent of children with diarrhoea receive ORS or increased fluids whilst 65 per cent receive ORT (ORS or recommended homemade fluids or increased fluids). Combining the information in Table CH.5 with that in Table CH.4 on oral rehydration therapy, it is observed that 38 per cent of children receive ORT with continued feeding as is the recommendation. Up to 35 per cent of children do not receive any treatment at all with only 22 per cent of the children with diarrhoea receiving antibiotics.

The proportion of children who receive ORT with continued feeding varies by gender and area of residence (Figure CH. 4). For example, more girls (44 per cent) than boys (33 per cent) receive ORT with continued feeding. Likewise, 41 per cent of children who are in urban areas receive ORT with continued feeding compared to 36 per cent among those from rural areas.

**Table CH.6: Oral rehydration therapy with continued feeding and other treatments**

Percentage of children age 0-59 months with diarrhoea in the last two weeks who received oral rehydration therapy with continued feeding, and percentage of children with diarrhoea who received other treatments, Kisumu County, 2011														
					Children with diarrhoea who received:									
					ORS or increased fluids	ORT (ORS or recommended homemade fluids or increased fluids)	ORT with continued feeding [1]	Pill or syrup: Antibiotic	Pill or syrup: Ant motility	Pill or syrup: Zinc	Pill or syrup: Other	Pill or syrup: Unknown	Injection: Antibiotic	Injection: Unknown
										Other treatment:				

**Figure CH.4: Percentage of children under age 5 with diarrhoea who received ORT or increased fluids, AND continued feeding, Kisumu County, 2011**

### Care Seeking and Antibiotic Treatment of Pneumonia

Pneumonia is the leading cause of death in children and the use of antibiotics in under-5s with suspected pneumonia is a key intervention. The 'A World Fit for Children' goal is to reduce deaths due to acute respiratory infections by one-third.

Children with suspected pneumonia are those who had an illness with a cough accompanied by rapid or difficult breathing and whose symptoms were NOT due to a problem in the chest and a blocked nose.

The indicators are:

- Prevalence of suspected pneumonia
- Care seeking for suspected pneumonia
- Antibiotic treatment for suspected pneumonia
- Knowledge of the danger signs of pneumonia

Table CH.7 presents the prevalence of suspected pneumonia and, if care was sought outside the home, the site of care. On average 6 per cent of children in Kisumu County aged 0-59 months were reported to have had symptoms of pneumonia during the two weeks preceding the survey.

Of all children with suspected pneumonia, about half (52 per cent) were taken to an appropriate provider. Table CH.7 also presents the use of antibiotics for the treatment of suspected pneumonia in children under five years old. More than 2 out of three (63 per cent) of the suspected cases of pneumonia received antibiotics in the last two weeks prior to the survey.

**Table CH.7: Care seeking for suspected pneumonia and antibiotic use during suspected pneumonia, Kisumu County, 2011**

Percentage of children age 0-59 months with suspected pneumonia in the last two weeks who were taken to a health provider and percentage of children who were given antibiotics

## Solid Fuel Use

More than 3 billion people around the world rely on solid fuels (biomass and coal) for their basic energy needs, including cooking and heating. Cooking and heating with solid fuels leads to high levels of indoor smoke, a complex mix of health-damaging pollutants. The main problem with the use of solid fuels is products of incomplete combustion, including CO, polyaromatic hydrocarbons, SO<sub>2</sub>, and other toxic elements. The use of solid fuels increases the risks of acute respiratory illness, pneumonia, chronic obstructive lung disease, cancer, low birth weight, cataracts, asthma and possibly tuberculosis. The primary indicator is the proportion of the population using solid fuels as the primary source of domestic energy for cooking.

Table CH.9: Solid fuel use

[1] MICS indicator 3.11

() Based on 25-49 unweighted cases.

Overall, about 9 out of 10 (91 per cent) of household members in Kisumu County are using solid fuels for cooking. Use of solid fuels is lower in urban (78 per cent) than rural areas (97 per cent). More residents from households where the head has attained secondary level education or higher use solid fuels compared to households where the head is uneducated (92 per cent compared to 78 per cent respectively) in Kisumu County. The proportion of household members who use solid fuels is lower among those from the richest wealth quintile households, compared to other quintiles. For example, all resident from the poorest wealth index quintile use solid fuels compared to 75 per cent of those from the richest wealth index quintile. The most common sources of solid fuel are wood (65 per cent) and charcoal (26 per cent).

Solid fuel use alone is not the best proxy for indoor air pollution, since the concentration of the pollutants is different when the same fuel is burnt in different stoves or fires. Use of closed stoves with chimneys minimizes indoor pollution, while open stove or fire with no chimney or hood do not protect from the harmful effects of solid fuels. Solid fuel use by place of cooking is depicted in Table CH.10.

Thirty four (34) per cent of Kisumu residents use solid fuel for cooking in a room used for living or sleeping whilst the rest either use a separate room (38 per cent), a separate building (18 per cent) and outdoors (10 per cent).

The proportion cooking in a place used for living or sleeping ranges from 43 per cent among those in urban areas to 31 per cent in rural areas. Similarly, the proportion of household members cooking with solid fuels in a room used for living or sleeping ranges from 52 per cent among those from the poorest wealth index households, to 30 and 28 per cent among those from Richest and fourth household wealth index households.

**Table CH.10: Solid fuel use by place of cooking**

Per cent distribution of household members in households using solid fuels by place of cooking, Kisumu County, 2011

## Malaria

Malaria is a leading cause of death of children under age five in Kenya. It also contributes to anaemia in children and is a common cause of school absenteeism. Preventive measures, especially the use of mosquito nets treated with insecticide (ITNs), can dramatically reduce malaria mortality rates among

children. In Kenya, the Ministry of Public Health and Sanitation (MOPHS) and the Ministry of Medical Services (MOMS) recommend that, owing to widespread resistance to anti-malarial drugs chloroquine, Sulphadoxine –Pyrimethamine (SP/Fansidar) and amodiaquine, these have been replaced with artemisinin combinations therapy for first line treatment of malarial fevers in Kenya. All patients with fever or history of fever should be tested for malaria and only patients who test positive should be treated with artemisinin combination therapy.

Children with severe malaria symptoms, such as fever or convulsions, should be taken to a health facility. Also, children recovering from malaria should be given extra liquids and food and younger children should continue breastfeeding. To prevent malaria in pregnancy, Intermittent Preventive Treatment of malaria in Pregnancy (IPTp) with 3 doses of SP is recommended. To augment malaria control efforts, integrated vector control methods (such as the use of long lasting insecticide treated nets (LLINs) and indoor residual spraying (IRS) are recommended.

The MICS questionnaire incorporates questions on the availability and use of bed nets, both at household level and among children under five years of age and pregnant women, as well as anti-malarial treatment, IPTp, and IRS of households.

**Table CH.11: Household availability of insecticide treated nets and protection by a vector control methods**

Percentage of households with at least one mosquito net, percentage of households with at least one long-lasting treated net, percentage of households with at least one insecticide treated net (ITN) and percentage of households which either have at least one ITN or have received spraying through an indoor residual spraying (IRS) campaign in the last 12 months, Kisumu County, 2011

In Kisumu County, the survey results indicate a high level of net ownership with 89 per cent of households having at least one ITN, 92 per cent having at least one mosquito net and 84 per cent of households have LLIN (Table CH.11). An equally high proportion of households have at least one ITN or received IRS during the last 12 months (93 per cent). This fairly high proportion of net ownership in Kisumu County is attributable to the rapid scale up of ITNs distribution in the region in the months shortly before the survey. The availability of nets and vector control methods does not vary markedly by background characteristics.

Table CH.12 presents findings for children age 0-59 months who slept under a mosquito net during the previous night. The results show that 84 per cent of children under the age of five slept under any mosquito net the night prior to the survey and 78 per cent slept under an insecticide treated net (Table CH.12). The proportion of children sleeping under either any type of mosquito nets or more specifically an ITN does not vary markedly by most background characteristics. For example, 77 per cent of male children slept under ITNs whereas the corresponding figure for females is 79 per cent.

Table CH.13 presents the proportion of pregnant women who slept under a mosquito net during the previous night. Nearly 9 out of 10 pregnant women slept under any nets in Kisumu County, with the proportion dropping down to 83 per cent for those who slept in an insecticide treated net.

(\*) Not shown, based on less than 25 unweighted cases. ( ) Based on 25-49 unweighted cases.

Questions on the prevalence and treatment of fever were asked for all children under age five. Twenty six per cent of children under five were ill with fever in the two weeks prior to the survey, with hardly any differences by gender (Table CH.14). Prevalence of fever amongst children ranges from 29 per cent among those living in rural areas to 19 per cent among those in urban areas. Thirty two per cent of children ages 48-59 months had fever compared to 17 per cent among those aged 0-11 months. The prevalence of fever across the wealth quintiles ranges from 37 per cent among those from the second household wealth quintile to 17 per cent among those from the richest households.

Mothers were asked to report all of the medicines given to a child to treat the fever, including both medicines given at home and medicines given or prescribed at a health facility. Slightly more than half (52 per cent) received any anti-malarial drug. The proportions of children who received anti-malarial drugs were comparable across gender and area of residence. Only 39 per cent of children received artemisinin combination therapy, the recommended first line treatment of malarial fevers. Some children treated with drugs which have been shown to be ineffective against malarial fevers due to drug resistance. For example, up to 5 per cent of children were given SP/Fansidar, 3 per cent were treated with quinine and up to 6 per cent received other types of anti-malaria drugs.

Besides antimalarial drugs, children with malarial fever are given other types of medicines with most children receiving anti-pyretics such as paracetamol (54 per cent).

Thirty seven per cent receive anti-malarial drugs within 24 hours or on the next day after onset of symptoms. The promptness of treatment with artemisinin combination treatments or any other kind of anti-malarials does not vary by gender or urban-rural classification.

Pregnant women living in places where malaria is highly prevalent are four times more likely than other adults to get malaria and twice as likely to die of the disease. Once infected with malaria, pregnant women are predisposed to anaemia, premature delivery and stillbirth. Their babies are likely to be of low birth weight, which makes them unlikely to survive their first year of life. For this reason, steps are taken to protect pregnant women by distributing insecticide-treated mosquito nets and treatment during antenatal check-ups with drugs that prevent malaria infection (Intermittent preventive treatment or IPTp). In the Kisumu County MICS, women were asked of the medicines they had received in their last pregnancy during the 2 years preceding the survey. Women are considered to have received intermittent preventive therapy if they have received at least 2 doses of SP/Fansidar during the pregnancy.

Intermittent preventive treatment for malaria in pregnant women who gave birth in the two years preceding the survey is presented in Table CH.16. Overall, the majority (95 per cent) of women aged 15-49 who had a live birth in the 2 years preceding the survey receive antenatal care, with no major differences between urban and rural areas (99 per cent and 93 per cent respectively). Up to 72 per cent of pregnant women received any medicine to prevent malaria at any ANC visit during pregnancy whilst slightly more than a quarter (27 per cent) of pregnant women received at least 1 dose of SP/Fansidar. Only about one fifth (19 per cent) received the recommended IPTp dose (SP/Fansidar 2 or more times). The proportion of women who receive IPTp differs depending on area of residence. About 24 per cent Women from urban received IPTp versus 15 per cent for their rural counterparts.

**Table CH.16: Intermittent preventive treatment for malaria**

Percentage of women age 15-49 years who had a live birth during the two years preceding the survey and who received intermittent preventive treatment (IPTp) for malaria during pregnancy at any antenatal care visit, Kisumu county, 2011

## VII. Water and Sanitation

---

Safe drinking water is a basic necessity for good health. Unsafe drinking water can be a significant carrier of diseases such as trachoma, cholera, typhoid, and schistosomiasis. Drinking water can also be tainted with chemical, physical and radiological contaminants which are harmful to human health. In addition to its association with disease, drinking water may be particularly important for women and children, especially in rural areas, who bear the primary responsibility for carrying it, often for long distances.

The MDG goal is to reduce the proportion of people without sustainable access to safe drinking water and basic sanitation by half between 1990 and 2015. The 'A World Fit for Children' goal calls for a reduction in the proportion of households without access to hygienic sanitation facilities and affordable and safe drinking water by at least one-third.

The list of indicators used in MICS is as follows:

### Water

- Use of improved drinking water sources
- Use of adequate water treatment method
- Time to source of drinking water
- Person collecting drinking water

### Sanitation

- Use of improved sanitation facilities
- Sanitary disposal of child's faeces

For more details on water and sanitation and to access some reference documents, please visit the UNICEF childinfo website <http://www.childinfo.org/wes.html>.

### Use of Improved Water Sources

The distribution of the population by source of drinking water is shown in Table WS.1 and Figure WS.1. The population using *improved sources* of drinking water are those using any of the following types of supply: piped water (into dwelling, compound, yard or plot, public tap/standpipe), tube well/borehole, protected well, protected spring, and collected rainwater. Bottled water is considered as an improved water source only if the household is using an improved water source for other purposes, such as handwashing and cooking.

Table WS.1: Use of improved water sources

Per cent distribution of household population according to main source of drinking water and percentage of household population using improved drinking water sources, Kisumu County, 2011																					
		Main source of drinking water																			
		Improved sources						Unimproved sources												Percentage using improved sources of drinking water [1]	
		Piped water			Tube-well/ bore-hole	Protected well	Protected spring	Rain-water collection	Bottled water	Unprotected well	Unprotected spring	Tanker-truck	Cart with small tank/drum	Surface water	Other

[1] MICS indicator 4.1; MDG indicator 7.8

( ) Based on 25-49 unweighted cases.

Note: \* Households using bottled water as the main source of drinking water are classified into improved or unimproved drinking water users according to the water source used for other purposes such as cooking and handwashing.

Overall, less than half (48 per cent) of the population is using an improved source of drinking water in Kisumu County. The most frequently used improved drinking water source is public tap/standpipe (14 per cent) whilst the most commonly used unimproved source of drinking water is surface water (24 per cent).

The use of improved water sources differs by area of residence and household wealth status. Sixty four per cent of the household population in the urban regions has access to improved sources of drinking water compared to 42 per cent of their rural counterparts. The dominant source of drinking water in urban regions is public tap/standpipe (22 per cent), whereas in rural areas it is protected wells (10 per cent). In Kisumu county, the proportion of household population from the richest wealth quintile who use improved source of drinking water is about four times that those from the poorest wealth quintile (15 per cent for the poorest quintile compared to 68 per cent for the richest wealth quintile).

**Figure WS.1: Percentage distribution of household members by source of drinking water, Kisumu County, 2011**

### Use of Adequate Water Treatment Method

Use of in-house water treatment is presented in Table WS.2. Households were asked of ways they may be treating water at home to make it safer to drink - boiling, adding bleach or chlorine, using a water filter, and using solar disinfection were considered as proper treatment of drinking water. The table shows water treatment by all households and the percentage of household members living in households using unimproved water sources but using appropriate water treatment methods.

Overall, 71 per cent of household members in Kisumu County who use unimproved drinking water sources use an appropriate water treatment method. The water treatment methods commonly used are adding bleach/chlorine (54 per cent) and boiling water (23 per cent). However, more than a quarter of the households (27 per cent) whose drinking water sources are unimproved are not using any water treatment methods. The proportion of household members who treat their water is comparable in urban and rural areas (72 and 71 per cent respectively). The proportion of household members in households using unimproved drinking water sources who use an appropriate water treatment method ranges from 86 per cent among those from the richest households to 65 per cent among the poorest households.

## Time to source drinking water

The amount of time it takes to obtain water is presented in Table WS.3 and the person who usually collected the water in Table WS.4. Note that these results refer to one roundtrip from home to drinking water source. Information on the number of trips made in one day was not collected.

Overall, Table WS.3 shows that for 28 per cent of household population that use improved drinking water sources have the water source on the premises. The proportion of the population using improved drinking sources in the urban households and have water on the premises is 45 per cent compared to 21 per cent for those in rural areas. The proportion of household members having an improved water source on their premises is 51 per cent amongst those from the richest wealth quintile compared to 5 per cent for those from the poorest wealth quintile.

**Table WS.3: Time to source of drinking water**

( ) Based on 25-49 unweighted cases.										

The time to source drinking water varies by place of residence, household wealth and type of drinking water source (improved or unimproved). Amongst users of improved water sources, 23 per cent take less than 30 minutes to fetch water from their improved drinking water source, whilst for 10 per cent, this task requires 30 minutes or more. In addition, the proportion taking less than 30 minutes or less to source water from their improved water source ranges from 13 per cent among those from the poorest wealth quintile to 28 per cent among those from the richest wealth quintile households.

Amongst users of improved drinking water sources, 34 per cent of those living in urban households take less than 30 minutes to source drinking water compared to 18 per cent for those from the rural areas. The proportion of household population using improved water sources who take 30 minutes or more to fetch water ranges from 6 per cent in urban areas to 12 per cent in rural areas. On the other hand, the proportion of the household population using unimproved water sources who take more than 30 minutes or more to collect water ranges from 40 per cent among the poorest households to less than 4 per cent among the richest households.

## Person Collecting Water

Table WS.4 shows that for the majority of households where the source of drinking water is not on the premises (82 per cent), an adult female is the most likely person collecting the water (74 per cent), followed by an adult man (20 per cent). The proportion of an adult woman being responsible for water collection for use in the household is high in the rural areas (78 per cent) versus 64 per cent for urban areas. Similarly, the proportion of adult women collecting water ranges from 85 per cent among those from the poorest households to 64 per cent in the richest households.

**Table WS.4: Person collecting water**

Percentage of households without drinking water on premises, and per cent distribution of households without drinking water on premises according to the person usually collecting drinking water used in the household, Kisumu County, 2011									
	Percentage of households without drinking water on premises	Number of households	Person usually collecting drinking water						Number of households without drinking water on premises
			Adult woman	Adult man	Female child (under 15)	Male child (under 15)	Missing/ DK	Total

Fourth	87.7	297	74.5	20.0	4.4	1.1	0.0	100.0	284
Richest	62.8	449	63.5	34.5	1.4	0.5	0.0	100.0	329
Total	81.5	1260	74.0	20.3	4.1	1.6	0.1	100.0	1123

Only 1 in 5 households has an adult man responsible for collection of water (20 per cent), and the proportion is higher in urban (32 per cent) than rural areas (15 per cent). Men are more likely to be involved in water collection in households where the household head has no education (27 per cent) compared to those where the head has attained primary or secondary level education (18 per cent). Similarly, the proportion of men involved in water collection ranges from 8 per cent among those from the poorest households to 35 per cent for the richest households. Female or male children under age 15 engage in water collection activities in 6 per cent of the households.

## Use of Improved Sanitation Facilities

Inadequate disposal of human excreta and personal hygiene is associated with a range of diseases including diarrhoeal diseases and polio. An improved sanitation facility is defined as one that hygienically separates human excreta from human contact. Improved sanitation can reduce diarrheal disease by more than a third, and can significantly lessen the adverse health impacts of other disorders responsible for death and disease among millions of children in developing countries. Improved sanitation facilities for excreta disposal include flush or pour flush to a piped sewer system, septic tank, or latrine; ventilated improved pit latrine, pit latrine with slab, and composting toilet.

More than half (55 per cent) of the household population in Kisumu County are living in households using improved sanitation facilities (Table WS.5). Overall, of all improved sanitation facilities, pit latrines with slabs are the most frequently used (33 per cent) - 37 per cent in urban areas and 32 per cent in rural areas. Only 10 per cent use the flush system in their households. While 9 per cent have no sanitation facilities and therefore resort to open defecation.

The use of improved sanitation facilities is much higher in urban (77 per cent) than rural areas (45 per cent). The table also indicates that the proportion of the population using improved sanitation facilities increases from 18 per cent for those from households in the poorest wealth quintile to 88 per cent for those from richest wealth quintile households.

On the other hand, 45 per cent of the population in Kisumu County use unimproved sanitation facilities. The highest proportion of the population using unimproved sanitation facilities is found in rural areas (55 per cent). The most commonly used unimproved sanitation facility is a pit latrine without a slab (35 per cent) and open defecation (9 per cent). A higher proportion of household members in rural areas use pit latrines without slab/open pit (43 per cent) compared to their urban counterparts (19 per cent).

The proportion of household members using unimproved sanitation facilities is higher amongst those from the poorest wealth quintile (82 per cent) compared to those from the richest wealth quintile (12 per cent).

**Table WS.5: Types of sanitation facilities**

Per cent distribution of household population according to type of toilet facility used by the household, Kisumu County, 2011

## Use and sharing of sanitation facilities

Access to safe drinking-water and to basic sanitation is measured by the proportion of population using an improved sanitation facility. MDGs and WHO / UNICEF Joint Monitoring Programme (JMP) for Water Supply and Sanitation classify households as using an unimproved sanitation facility if they are using otherwise acceptable sanitation facilities but sharing a facility between two or more households or using a public toilet facility.

As shown in Table WS.6, only 1 out of 4 household members in Kisumu County use private improved sanitation facilities that are not shared. While another 26 per cent use shared improved sanitation facilities. About 14 per cent use unimproved sanitation facilities that are not shared.

The proportion of not-shared improved sanitation facilities is higher in urban areas (34 per cent) than in rural areas (21 per cent). The proportion of the population who use open defecation is high in rural areas (12 per cent) versus urban areas (4 per cent). Across the wealth quintiles, the proportion of those using improved sanitation facilities that are not shared ranges from 13 and 10 per cent among the poorest and second poorest household members to 43 per cent among the richest. Similarly, the proportion of those using open defecation is high among the poorest household members (20 and 22 per cent among the poorest and second poorest members, respectively) and lower among members from the richest households (2 per cent).

**Table WS.6: Use and sharing of sanitation facilities**

Percentage distribution of household population by use of private and public sanitation facilities and use of shared facilities, by users of improved and unimproved sanitation facilities, Kisumu County, 2011

## Disposal of child's faeces

Safe disposal of a child's faeces is disposing of the stool by the child using a toilet or by rinsing the stool waste into a toilet or latrine. The disposal of faeces of children 0-2 years of age is presented in Table WS.7. Overall in Kisumu County, stools were disposed safely for majority (78 per cent) of children aged 0-2 years. The most common method of disposing children's stools in households where there is a sanitation facility is to put/rinse into toilet or latrines (77 per cent).

The percentage of children whose stools is disposed of safely was marginally higher for households in which there was an improved sanitation facility (89 per cent) than in those in the sanitation facility was unimproved (80 per cent).

The place of stool disposal varies with the area of residence and wealth status. Toilets or latrines are more likely to be used in urban (83 per cent) than rural areas (76 per cent).

**Table WS.7: Disposal of child's faeces**

## Drinking water and sanitation ladders

In its 2008 report<sup>7</sup>, the JMP developed a new way of presenting the access figures, by disaggregating and refining the data on drinking-water and sanitation and reflecting them in “ladder” format. This ladder allows a disaggregated analysis of trends in a three rung ladder for drinking-water and a four-rung ladder for sanitation. For sanitation, this gives an understanding of the proportion of population with no sanitation facilities at all, of those reliant on technologies defined by JMP as “unimproved,” of those sharing sanitation facilities of otherwise acceptable technology, and those using “improved” sanitation facilities. Table WS.8 presents the percentages of household population by drinking water and sanitation ladders. The table also shows the percentage of household members using improved sources of drinking water and sanitary means of excreta disposal.

In Kisumu County, 48 per cent of the population use improved drinking water, and only 25 per cent use improved sanitation facilities. The two proportions increase with increasing levels of household wealth index from 15 per cent for population in the poorest wealth quintile to 68 per cent for those in the richest quintile for improved drinking water sources, and from 13 per cent for the population in the poorest wealth quintile to 43 per cent for those in the richest quintile for improved sanitation facilities.

Only 16 per cent of the population have both improved drinking water sources and improved sanitation facilities. This differs by area of residence and the level of household wealth. Whilst only 11 per cent of the rural population has access to both, this proportion more than doubles in the urban areas (29 per cent). The proportion using both improved drinking water sources and improved sanitation facilities increases from 1 per cent in the poorest wealth quintile to 35 per cent in the richest quintile.

## Hand washing

Handwashing with water and soap is the most cost effective health intervention to reduce both the incidence of diarrhoea and pneumonia in children under five. It is most effective when done using water and soap after visiting a toilet or cleaning a child, before eating or handling food and, before feeding a child. Monitoring correct handwashing behaviour at these critical times is challenging. A reliable alternative to observations or self-reported behaviour is assessing the likelihood that correct handwashing behaviour takes place by observing if a household has a specific place where people most often wash their hands and observing if water and soap (or other local cleansing materials) are present at a specific place for handwashing.

In Kisumu County, a place of handwashing is observed in 11 per cent of the households. The place of handwashing is observed more frequently in urban households (19 per cent) than in rural households (7 per cent). For the households where the place of handwashing is not observed (89 per cent), the handwashing place is either not in the dwelling/plot/yard (88 per cent) or the interviewer had no permission to see it (1 per cent) (Table WS.9).

Of the 137 households where place of handwashing was observed, only 69 per cent have both water and soap present at the designated place whilst 6 per cent have no water or soap available. Sixteen per cent have only water available and 9 per cent have only soap available.

The proportion of households who have both water and soap at their designated handwashing areas is higher in urban (82 per cent) than in rural areas (49 per cent). The proportion having both water and soap available does not vary markedly by the education level of the household head or wealth index quintiles.

**Table WS.9: Water and soap at place for handwashing**

## Availability of soap

Overall, 93 per cent of the households in Kisumu County have soap anywhere in the dwelling. The availability of soap somewhere in the household does not vary markedly by the level of education of the household head. On the other hand, the proportion of households in which soap was seen increases from 86 per cent amongst households in the poorest wealth quintile to 96 per cent amongst households in the richest wealth quintile.

Of the households where the place of handwashing was observed, soap was observed at the designated handwashing place in 9 per cent of the households whilst it was shown to the interviewer in 2 per cent of the households. (Table WS.10).

Interestingly, handwashing soap was observed in 83 per cent of households where a place for handwashing was not available. The proportion showing soap was higher in rural (86 per cent) than urban areas (77 per cent).

Table WS.10: Availability of soap

## VIII. Reproductive Health

### Fertility

In MICS4, Age Specific Fertility Rates (ASFR) and Total Fertility Rates (TFR) are calculated by using information on birth histories of women aged 15-49 years from the sampled households. Birth histories include details of all children ever born alive to a woman, such as child's name, sex, month and year of birth, survival status and if dead, the age at death. Current fertility rates are based on the date of last birth of each woman for the three years preceding the survey. Rates are underestimated by a very small margin due to absence of information on multiple births (twins, triplets etc.) and on women having multiple deliveries during the periods preceding the survey.

ASFRs are calculated by dividing the number of births to women in a specific age group by the number of women years lived during a given period, and is expressed per 1000 women. The Total Fertility Rate (TFR) is calculated by summing the age-specific fertility rates calculated for each of the 5-year age groups of women, from age 15 through to age 49. The TFR denotes the average number of children to which a woman will have given birth by the end of her reproductive years if current fertility rates prevailed

Table RH.1 shows age specific fertility rates and total fertility rate. For the three year period preceding the MICS survey, the Total Fertility Rate in Kisumu County was 4.8 children per woman. The adolescent birth rate (age-specific fertility rate for women age 15-19) during the same period was 199 births per 1000 women. ASFR is highest in the 20 to 24 age group. Interestingly, fertility seems to have increased in the 15-19 and 20-24 age groups over the last decade before the MICS survey.

**Table RH.1: Current fertility**

Age specific fertility rates (ASFR) and total fertility rate (TFR) for three year periods preceding the survey, Kisumu County, 2011					
	Age specific fertility rates (ASFR)

[1] MICS indicator 5.1; MDG indicator 5.4					
Note: Age-specific fertility rates are per 1,000 women.					

### Children ever born and children surviving

Table RH.1a presents the distribution of children ever born and surviving for all women by age groups. The mean number of children ever born to all women aged 15-49 years is 3 and that of those surviving is 2.5. Women in Kisumu County attain a parity of 5.9 children per woman at the end of their childbearing period; this number is 1.1 children above the current total fertility rate (4.8 children per woman).

**Table RH.1a: Children ever born and children surviving**

Mean and total numbers of children ever born and children surviving by age of women, Kisumu County, 2011					
	Children ever born		Children surviving		Number of women
	Mean	Total	Mean	Total

Total	3.0	2744	2.5	2333	926

### Early childbearing

Sexual activity and childbearing early in life carry significant risks for young people all around the world. Table RH.2 presents some early childbearing indicators for women age 15-19 and 20-24 while Table RH.3 presents the trends for early childbearing.

As shown in Table RH.2, 33 per cent of women aged 15-19 have already had a birth, 1 per cent of these women are pregnant with their first child, 34 per cent have begun childbearing and 5 per cent have had a live birth before age 15. The proportion of women aged 15-19 years who have begun childbearing is 38 per cent among urban women and 32 per cent for rural women in Kisumu County.

Forty (40) per cent of women aged 20-24 years have had a live birth before age 18. The proportion of women aged 20-24 years who have had a live birth before age 18 ranges from 43 per cent in rural areas to 37 per cent in urban areas.

**Table RH.2: Early childbearing**

Percentage of women age 15-19 years who have had a live birth or who are pregnant with the first child and percentage of women age 15-19 years who have begun childbearing, percentage of women who have had a live birth before age 15, and percentage of women age 20-24 who have had a live birth before age 18, Kisumu County, 2011							
	Percentage of women age 15-19 who:				Number of women age 15-19	Percentage of women age 20-24 who have had a live birth before age 18 [1]	Number of women age 20-24

(\*) Not shown, based on less than 25 unweighted cases.

() Based on 25-49 unweighted cases.

### Trends in early childbearing

Overall, 8 per cent of women aged 15-49 years had a live birth before age 15 while 39 per cent of women aged 20-49 years have had a live birth before age 18 as shown in Table RH.3. About 10 per cent of women aged 15-49 years in rural areas had a live birth before age 15 compared to 6 per cent in urban areas. Similarly, 44 per cent of women aged 20-49 years in rural areas had a live birth before age 18 compared to 30 per cent in urban areas.

**Table RH.3: Trends in early childbearing**

 Figures in the total row are based on women age 15-49 and 20-49 for live births before age 15 and age 18, respectively.

## Contraception

Appropriate family planning is important to the health of women and children by: 1) preventing pregnancies that are too early or too late; 2) extending the period between births; and 3) limiting the number of children. Access by all couples to information and services to prevent pregnancies that are too early, too closely spaced, too late or too many is critical.

Current use of contraception was reported by 44 per cent of women who are currently married or in union (Table RH.4). Modern methods of contraception are more commonly used (43 per cent) than traditional methods (1 per cent), with injectable contraceptives being the most popular method -used by one in four (25 per cent) married women in Kisumu County. The next most popular method is implants, accounting for 6 per cent of use among married women. Between one and four per cent of women reported use of the male condom, the pill, female sterilization, and intrauterine devices (IUDs). Less than 1 per cent use periodic abstinence, diaphragm or foam or jelly, lactational amenorrhea method (LAM) or withdrawal.

Contraceptive prevalence ranges from 49 per cent among women in the urban areas to 42 per cent for those in rural areas. The contraceptive prevalence rates for any method across household wealth index levels ranges from 27 per cent among the poorest to 52 per cent among those from the richest households.

Injectable contraceptives are the most commonly used contraceptives across all education levels with the highest prevalence (26 per cent) observed among women with secondary or higher education and lowest (19 per cent) among women with no education. Women with no education (5 per cent) are more likely to use IUDs than those with secondary or higher education (2 per cent).

Non use of contraceptives has important implications on fertility and hence child bearing and consequently population growth. The proportion of married women not using any form of contraceptives in Kisumu County is 56 per cent. Fifty nine per cent of the married rural women are not using any method while 51 per cent of the urban ones do not use any too. Similarly, 66 per cent of the women with one living child are not using any method.

Table RH.4: Use of contraception

## Antenatal Care

The antenatal period presents important opportunities for reaching pregnant women with a number of interventions that may be vital to their health and well-being and that of their infants. Better understanding of foetal growth and development and its relationship to the mother's health has resulted in increased attention to the potential of antenatal care as an intervention to improve both maternal and new-born health. For example, if the antenatal period is used to inform women and families about the danger signs and symptoms and about the risks of labour and delivery, it may provide the route for ensuring that pregnant women do, in practice, deliver with the assistance of a skilled health care provider. The antenatal period also provides an opportunity to supply information on birth spacing, which is recognized as an important factor in improving infant survival. Tetanus immunization during pregnancy can be life-saving for both the mother and infant. The prevention and treatment of malaria among pregnant women, management of anaemia during pregnancy and treatment of STIs can significantly improve foetal outcomes and improve maternal health. Adverse outcomes such as low birth weight can be reduced through a combination of interventions to improve women's nutritional status and prevent infections (e.g. malaria and STIs) during pregnancy. More recently, the potential of the antenatal period as an entry point for HIV prevention and care, in particular for the prevention of HIV transmission from mother to child, has led to renewed interest in access to and use of antenatal services.

WHO recommends a minimum of four antenatal visits based on a review of the effectiveness of different models of antenatal care. WHO guidelines are specific on the content on antenatal care visits, which include:

- Blood pressure measurement
- Urine testing for bacteriuria and proteinuria
- Blood testing to detect syphilis and severe anaemia
- Weight/height measurement (optional)

The type of personnel providing antenatal care to women aged 15-49 years who gave birth in the two years preceding the survey is presented in Table RH.6. Coverage of antenatal care (by a doctor, nurse, midwife, clinical officer or community nurse) is high in Kisumu County with 95 per cent of women receiving antenatal care at least once during the pregnancy. The high proportion received care from a nurse or midwife (61 per cent). Antenatal care coverage is 6 per cent more in urban areas than in rural areas. Less than 1 per cent of women received antenatal care from traditional birth attendants while 3 per cent did not receive any antenatal care.

## Number of antenatal care visits

UNICEF and WHO recommend a minimum of at least four antenatal care visits during pregnancy. Table RH.7 shows the number of antenatal care visits during the last pregnancy for the two years preceding the survey, regardless of provider by selected characteristics. At least nine in ten mothers (92 per cent) received antenatal care more than once whilst more than half (52 per cent) received antenatal care at least four times. Moreover, a higher proportion (59 per cent) of mothers from urban areas had more than four antenatal care visits than those from the rural areas (49 per cent).

**Table RH.7: Number of antenatal care visits**

## Content of antenatal care

The types of services pregnant women received are shown in table RH.8. Among those women who gave birth to a child during the two years preceding the survey, 77 per cent reported that a blood sample had been taken during an antenatal care visit, 95 per cent reported that their blood pressure had been checked whilst urine samples were taken for 91 per cent of cases. Generally, pregnant women from urban areas are more likely to receive services compared to their rural counterparts. For instance, a 89 per cent of women from urban areas received all three services compared to only 68 per cent of those from the rural areas. About 82 per cent women with secondary and higher education received all services compared to 72 per cent for those with primary education.

## Assistance at Delivery

Three quarters of all maternal deaths occur during delivery and the immediate post-partum period. The single most critical intervention for safe motherhood is to ensure a competent health worker with midwifery skills is present at every birth, and transport is available to a referral facility for obstetric care in case of emergency. The 'A World Fit for Children' goal is to ensure that women have ready and affordable access to skilled attendance at delivery. The indicators are the proportion of births with a skilled attendant and proportion of institutional deliveries. The skilled attendant at delivery indicator is also used to track progress toward the Millennium Development target of reducing the maternal mortality ratio by three quarters between 1990 and 2015. The MICS included a number of questions to assess the proportion of births attended by a skilled attendant. A skilled attendant includes a doctor, nurse, midwife, clinical officer or community nurse.

About 58 per cent of births in the two years preceding the MICS survey were delivered by skilled personnel (Table RH.9). Women in urban areas are more likely to have births delivered by a skilled attendant (78 per cent) than their rural counterparts (47 per cent).

In compliance with the recommendation that deliveries in health facilities be assisted by a skilled attendant, 95 per cent of births were assisted by a skilled attendant in public health facilities whilst in private facilities the corresponding figure is 97 per cent.

The highest proportion of births (38 per cent) was delivered with the assistance of a nurse or midwife in the two years preceding the MICS survey. Doctors assisted with the delivery of 17 per cent of births and clinical officers assisted with 2 per cent. Traditional birth attendants still play a substantial role and assisted with the delivery of 29 per cent of births. Four per cent (4) of births were assisted by a relative or friend while another 5 per cent of births had no attendant. About 11 per cent of births in urban areas are delivered by caesarean section compared to only 4 per cent in rural areas.

**Table RH.9: Assistance during delivery**

## Place of Delivery

Increasing the proportion of births that are delivered in health facilities is an important factor in reducing the health risks to both the mother and the baby. Proper medical attention and hygienic conditions during delivery can reduce the risks of complications and infection that can cause morbidity and mortality to either the mother or the baby. Table RH.10 presents the per cent distribution of women aged 15-49 years who had a live birth in the two years preceding the survey by place of delivery and the percentage of births delivered in a health facility, according to background characteristics.

Fifty six (56) per cent of births were delivered in a health facility in Kisumu County. More than a third (37 per cent) of deliveries occurred in public sector facilities whilst, 41 per cent and 18 per cent occurred in home and private sector facilities, respectively. The proportion of women who delivered in a health facility ranges from 79 per cent in urban areas to 43 per cent in rural Kisumu County. Among women who had more than 4 antenatal care visits, 65 per cent gave birth in health facility. The corresponding figure for those who had 1-3 ANC visits is 47 per cent. About one in two women in rural areas gives birth at home (53 per cent) compared to 18 per cent among those from urban areas.

## IX. Child Development

### Early Childhood Education and Learning

Attendance to pre-school education in an organized learning or child education program is important for the readiness of children to school. It is well recognized that a period of rapid brain development occurs in the first 3-4 years of life, and the quality of home care is a major determinant of the child's development during this period. In this context, adult activities with children, presence of books at home, for the child, and the conditions of care are important indicators of quality of child care. A World Fit for Children goal is that "children should be physically healthy, mentally alert, emotionally secure, socially competent and ready to learn". Information on a number of activities that support early learning and development was collected in the Kisumu County Multiple indicator Survey. These included the involvement of adults with children in the following activities: reading books or looking at picture books, telling stories, singing songs, taking children outside the home, compound or yard, playing with children, and spending time with children naming, counting, or drawing things.

Table CD.1 shows the percentage of children age 36-59 months currently attending early childhood education disaggregated by selected characteristics.

**Table CD.1: Early childhood education**

[1] MICS indicator 6.7		
() Based on 25-49 unweighted cases.		

About 53 per cent of children aged 36-59 months are attending pre-school (Table CD.1). Pre-school attendance increases with improving levels of mother's education. Only 48 per cent of children born

to mothers with primary education attended pre-school compared to 57 per cent of children born to mother with at least secondary education. There are observable variations by area of residence – the proportion is higher in urban (66 per cent) than rural areas (48 per cent). Whilst there are slight variations by gender, the variations by socioeconomic status are much more notable. About 72 per cent of children living in richest households attend pre-school, while the figures in the poorer wealth quintiles are much lower. The proportions of children attending pre-school at ages 36-47 months and 48-59 months are 39 and 66 per cent respectively.

Findings on adult participation in childhood development are presented in Table CD.2. For about 31 per cent of children under five, an adult household member engaged in more than four activities that promote learning and school readiness during the 3 days preceding the survey. The proportion of children with whom an adult engaged in learning activities is comparable for male and female children. However, the involvement of an adult household member in childhood development activities varied with area of residence, parent's educational level and household wealth index. Adults were more engaged in four or more activities with children living in urban (40 per cent) than rural areas (28 per cent). Moreover, the proportion of children with whom adults engaged in four or more activities is highest among children from households in the richest wealth quintile (47 per cent) compared to those from households in the lower wealth quintiles.

The table also indicates that the father's involvement in such activities was somewhat limited; fathers engaged with one or more activities for only 28 per cent of children. However, the proportion of children with whom the father engaged in one or more activities was higher for girls (34 per cent) than boys (23 per cent). Moreover, the proportion of children with whom the fathers engaged in one or more activities is highest among children from households in the richest wealth quintile (37 per cent) compared to those from households in the lower wealth quintiles.

Notably, only 36 per cent of children live in a household without their fathers. There are no major differences in the proportion of children who live in a household without their fathers by child's gender or household wealth index.

Table CD.2: Support for learning

Exposure to books in early years not only provides the child with greater understanding of the nature of print, but may also give the child opportunities to see others reading, such as older siblings doing school work. Presence of books is important for later school performance and IQ scores. The mother/caretaker of all children under 5 were asked about number of children's books or picture books they have for the child, household objects or outside objects, and homemade toys or toys that came from a shop that are available at home.

In Kisumu County, only 6 per cent of children age 0-59 months are living in households where at least 3 children's books are present (Table CD.3). The proportion of children with 10 or more books is less than 1 per cent. There is no major difference in the proportion of households reporting 3 or more books for children by child's gender. However, the proportion of households with 3 or more children's books was

higher in urban (13 per cent) than rural (3 per cent) areas. As expected, the proportion of households with more than 3 children's books is higher among households with older children (9 per cent for children aged 24-59 months compared to 2 per cent for children aged 0-23 months). Notably, the proportion of households with 3 or more children's books is highest among children whose mothers have no education (25 per cent). Similarly, the proportion of households with 3 or more children's books is highest among the richest households (16 per cent).

[1] MICS indicator 6.3							
[2] MICS indicator 6.4							

Table CD.3 shows that 62 per cent of children aged 0-59 months have 2 or more playthings to play with in their homes. The playthings probed for in MICS included homemade toys (such as dolls and cars, or other toys made at home), toys that came from a store, and household objects (such as pots and bowls) or objects and materials found outside the home (such as sticks, rocks, animal shells, or leaves). About 37 per cent of children play with toys that come from a store while 49 per cent play with homemade toys. Majority of children (74 per cent) play with household objects or other objects found outside the home.

The proportion of children who have 2 or more playthings to play with is 60 per cent among male children and 63 per cent among female children. The proportion of children with two or more playthings is highest amongst those living in the richest households (58 per cent).

Leaving children alone or in the presence of other young children is known to increase the risk of accidents. In Kisumu County MICS, two questions were asked to find out whether children aged 0-59 months were left alone during the week preceding the interview date, and whether children were left in the care of other children under 10 years of age.

Table CD.4 shows that 17 per cent of children aged 0-59 months were left in the care of another child younger than 10 years of age, while 37 per cent were left alone during the week preceding the interview. Combining the two care indicators, findings show that 42 per cent of children were left with inadequate care during the week preceding the survey, either by being left alone or in the care of another child. No major differences are observed by the sex of the child – 45 per cent and 39 per cent among male and female children respectively. However, the proportion of children left with inadequate care is higher in rural (47 per cent) than urban areas (30 per cent). Inadequate care is less prevalent among children whose mothers have no education (29 per cent) than amongst those whose mothers have primary or higher education. Children aged 24-59 months were left with inadequate care more (48 per cent) than those aged 0-23 months (32 per cent). The proportion of children left with inadequate care was lowest among children from the richest households.

## Early Childhood Development

Early child development is defined as an orderly, predictable process along a continuous path, in which a child learns to handle more complicated levels of moving, thinking, speaking, feeling and relating to others. Physical growth, literacy and numeracy skills, socio-emotional development and readiness to learn are vital domains of a child's overall development, which is a basis for overall human development.

A 10-item module that has been developed for the MICS programme was used to calculate the Early Child Development Index (ECDI). The indicator is based on some benchmarks that children would be expected to have if they are developing as the majority of children in that age group. The primary purpose of the ECDI is to inform public policy regarding the developmental status of children in Kisumu.

Each of the 10 items is used in one of the four domains, to determine if children are developmentally on track in that domain. The domains in question are:

- Literacy-numeracy: Children are identified as being developmentally on track based on whether they can identify/name at least ten letters of the alphabet, whether they can read at least four simple, popular words, and whether they know the name and recognize the symbols of all numbers from 1 to 10. If at least two of these is true, then the child is considered developmentally on track.
- Physical: If the child can pick up a small object with two fingers, like a stick or a rock from the ground and/or the mother/caretaker does not indicate that the child is sometimes too sick to play, then the child is regarded as being developmentally on track in the physical domain.
- In the social-emotional domain, children are considered to be developmentally on track if two of the following is true: If the child gets along well with other children, if the child does not kick, bite, or hit other children and if the child does not get distracted easily
- Learning: If the child follows simple directions on how to do something correctly and/or when given something to do, is able to do it independently, then the child is considered to be developmentally on track in the learning domain.

ECDI is then calculated as the percentage of children who are developmentally on track in at least three of these four domains. The results are presented in Table CD.5.

In Kisumu County, 42 per cent of children aged 36-59 months are developmentally on track. ECDI is marginally higher among boys (43 per cent) than girls (40 per cent). As expected, ECDI is much higher in older children compared to younger children (50 per cent among 48-59 months old compared to 33 per cent among 36-47 months old), since children accumulate more skills with increasing age. Higher ECDI is seen in children attending pre-school (54 per cent) compared to those not attending preschool (28 per cent). ECDI is highest amongst children from the richest households (52 per cent). The analysis of four domains of child development shows that 92 per cent of children are on track in the physical domain, but much less in the social-emotional (34 per cent), literacy-numeracy (45 per cent) and learning (53 per cent) domains. In both literacy-numeracy and learning domains, higher scores are observed among children living in urban areas, children attending preschool, older children, and those born to mothers with at least secondary education. Higher scores in both the physical and social-emotional domain are observed among children living in urban areas.

**Table CD.5: Early child development index**

**Percentage of children age 36-59 months who are developmentally on track in literacy-numeracy, physical, social-emotional, and learning domains, and the early child development index score, Kisumu County, 2011**

[1] MICS indicator 6.6

( ) Based on 25-49 unweighted cases.

MICS indicator 6.6, Early child development index is calculated as the percentage of children who are developmentally on track in at least three of the four component domains (literacy-numeracy, physical, social-emotional, and learning)

## X. Literacy and Education

### Literacy among Young Women

One of the 'A World Fit for Children' goals is to assure adult literacy. Adult literacy is also an MDG indicator, relating to both men and women. In MICS, since only a women's questionnaire was administered, the results are based only on females age 15-24. Literacy was assessed based on the ability of women to read a short simple statement or on school attendance.

The percentage of literate women is presented in Table ED.1. Table ED.1 indicates that 90 per cent of women in Kisumu County are literate and that literacy status varies by place of residence, age, education level and household wealth level. Among women who stated that primary school was their highest level of education, just 85 per cent were actually able to read the statement shown to them. Literacy level is higher in the urban (95 per cent) than rural areas (87 per cent). The proportion of literate women is slightly higher among those aged 15-19 (92 per cent) than those aged 20-24 (88 per cent). Among the middle wealth index households, only 84 per cent are literate compared to 96 per cent among those from the richest households.

**Table ED.1: Literacy among young women**

### School Readiness

Attendance to pre-school education in an organised learning or child education programme is important for the readiness of children to school. Table ED.2 shows the proportion of children in the first grade of primary school who attended pre-school the previous year. Overall, 74 per cent of children who are currently attending the first grade of primary school were attending pre-school the previous year. The proportion of males attending first grade (75 per cent) is comparable for females attending (73 per cent).

**Table ED.2: School readiness**

## Primary and Secondary School Participation

Universal access to basic education and the achievement of primary education by the world's children is one of the most important goals of the Millennium Development Goals and A World Fit for Children. Education is a vital prerequisite for combating poverty, empowering women, protecting children from hazardous and exploitative labour and sexual exploitation, promoting human rights and democracy, protecting the environment, and influencing population growth.

The indicators for primary and secondary school attendance include:

- Net intake rate in primary education
- Primary school net attendance ratio (adjusted)
- Secondary school net attendance ratio (adjusted)
- Female to male education ratio (or gender parity index - GPI) in primary and secondary school

The indicators of school progression include:

- Children reaching last grade of primary
- Primary completion rate
- Transition rate to secondary school

Among children who are of primary school entry age 6 in Kisumu County, 25 per cent are attending the first grade of primary school (Table ED.3). Primary school entry varies in rural and urban areas; the proportion entering grade 1 is higher in urban (33 per cent) than in rural areas (21 per cent). Similarly the proportion of female children (36 per cent) of primary school entry age entering grade 1 is higher than for males (13 per cent).

**Table ED.3: Primary school entry**

[1] MICS indicator 7.3 ( ) Based on 25-49 unweighted cases. (*) Not shown, based on less than 25 unweighted cases. <i>Primary school entry age is defined at the country level (usually based on UNESCO's ISCED classification).</i>			

Table ED.4 provides the percentage of children of primary school age 6 to 13 years who are attending primary or secondary school<sup>8</sup>. Although the majority of children of primary school age are attending school (81 per cent). It is noteworthy that 19 per cent of the children are out of school when they are expected to be participating in school. In urban areas, the net attendance ratio is 81 which is comparable to the 81 observed in rural areas of Kisumu County. As expected, the adjusted net attendance ratio is slightly lower amongst children from the poorest wealth quintile. Interestingly the adjusted net attendance ratio is higher amongst children whose mothers are uneducated (90 per cent) than amongst those whose mothers have primary (76 per cent) and secondary level education (89 per cent). The adjusted net attendance ratio of girls (83 per cent) is marginally higher than that of boys (79 per cent).

<sup>8</sup> Ratios presented in this table are "adjusted" since they include not only primary school attendance, but also secondary school attendance in the numerator.

**Table ED.4: Primary school attendance**

[1] MICS indicator 7.4; MDG indicator 2.1							

The secondary school net attendance ratio is presented in Table ED.5<sup>9</sup>. While about 81 per cent of children are attending primary school, only 27 per cent of children of secondary school age are attending secondary school. Of the remaining children of secondary school age, 58 per cent are attending primary school when they should be attending secondary school while the remaining 15 per cent are not attending school at all. Attendance of secondary school generally improves with age of the child and household social economic status. The proportion increases from 30 per cent among children whose mothers are uneducated to 38 per cent amongst those whose mothers have secondary or higher levels of education. The proportion attending secondary school increases from 13 per cent amongst children from the poorest wealth quintile to 41 per cent amongst those from the richest wealth quintile.

<sup>9</sup> Ratios presented in this table are “adjusted” since they include not only secondary school attendance, but also attendance to higher levels in the numerator.

[1] MICS indicator 7.5  
 () Based on 25–49 unweighted cases.

The percentage of children entering first grade who eventually reach the last grade of primary school is presented in Table ED.6. Of all children starting grade one, the majority (91 per cent) will eventually reach grade eight; this number includes children that repeat grades and that eventually move up to reach last grade. Progression between the other grades is generally high (over 96 per cent). The proportion of children reaching grade 8 (of those who enter grade 1) is slightly higher in rural (93 per cent) than urban areas (85 per cent). Whilst all children whose mothers have attained secondary level education reach grade 8 (of those who enter grade 1), this proportion is slightly lower amongst those whose mothers have primary level or no education (around 91 per cent). The proportion of children reaching grade 8 is slightly lower amongst children from the middle fourth and richest wealth quintiles than amongst those from the poorer wealth quintiles. The proportion reaching grade 8 is higher for boys (95 per cent) than girls (88 per cent).

Children reaching the last grade of primary, also known as the survival rate to the last grade of primary school, is the percentage of children entering the first grade of primary school who eventually reach the last grade of primary. This table assumes that primary school comprises 6 grades. In countries where primary school has more or fewer grades, columns of the table should be customized accordingly									

The primary school completion rate and transition rate to secondary education are presented in Table ED.7. The primary completion rate is the ratio of the total number of students, regardless of age, entering the last grade of primary school for the first time, to the number of children of the primary graduation age at the beginning of the current (or most recent) school year. At the time of the survey, the primary school completion rate was 88 per cent. School completion rate varies by gender. While 99 per cent of males complete primary school, the proportion is 76 per cent among females.

Notably, only 67 per cent of the children that completed the last grade of primary school were attending the first grade of secondary school at the moment the survey (transition rate to secondary school).

**Table ED.7: Primary school completion and transition to secondary school**

Primary school completion rates and transition rate to secondary school, Kisumu County, 2011

* Not shown, based on less than 25 unweighted cases.					

The ratio of girls to boys attending primary and secondary education is provided in Table ED.8. These ratios are better known as the Gender Parity Index (GPI). Notice that the ratios included here are obtained from net attendance ratios rather than gross attendance ratios. The last ratios provide an erroneous description of the GPI mainly because in most of the cases the majority of over-aged children attending primary education tend to be boys.

The table shows that gender parity for primary school is 1.06. This indicates that there is no difference in attendance between girls and boys. However, the indicator drops to 0.90 for secondary education. Primary school Gender Parity Index does not vary consistently with mother's education or area of residence.

The primary school adjusted NAR for girls and boys are 83 per cent and 79 per cent respectively. The primary and secondary school NAR are higher for children from the richest wealth index households. In addition, the secondary school NAR is higher among children whose mothers have secondary level education than among those whose mothers have primary level or no education.

<i>The gender parity index (GPI) is the ratio of female to male adjusted net attendance ratios (primary or secondary). The primary and secondary adjusted net attendance ratios are presented in more detail in tables ED.4 and ED.5.</i>							

## **XI. Child Protection**

---

### **Birth Registration**

The International Convention on the Rights of the Child states that every child has the right to a name and a nationality and the right to protection from being deprived of his or her identity. Birth registration is a fundamental means of securing these rights for children. One of the goals set in the 'A World Fit for Children' is to develop systems to ensure the registration of every child at or shortly after birth, and to fulfil his or her right to acquire a name and a nationality, in accordance with national laws and relevant international instruments. The indicator is the percentage of children under 5 years of age whose birth is registered.

Details on birth registration by selected characteristics in Kisumu County are presented in Table CP.1. The results show that Kisumu County registered over half (53 per cent) of the births of children under five years. The data shows that 55 per cent of male children are registered versus 51 per cent for females. Similarly, 66 per cent of children residing in urban areas are registered compared to 48 per cent for those in rural Kisumu County areas. The results for Kisumu County indicate that 68 per cent of children born to mothers with no education are registered compared to 49 per cent for those whose mothers have primary education and 59 per cent for those with mothers educated to secondary and above level. About one third of children from the poorest households (35 per cent) are registered compared to more than half for those from the richest households (53 per cent).

Though over half the children under 5 are registered, at least a third (36 per cent) do not have a birth certificate. A child may lack a birth certificate either because it was never issued or because it has been lost. Birth certificates were shown to an observer for only 5 per cent of children whose birth was reported to have been registered by civil authorities. The proportion of children whose birth certificates were seen by an observer was higher in the richest wealth quintile than in other wealth quintiles. Fourteen per cent of the mothers/caretakers of children whose birth was not registered knew how to register a birth.

**Table CP.1: Birth registration**

## Child Labour

Article 32 of the Convention on the Rights of the Child states: "States Parties recognize the right of the child to be protected from economic exploitation and from performing any work that is likely to be hazardous or to interfere with the child's education, or to be harmful to the child's health or physical, mental, spiritual, moral or social development." The 'A World Fit for Children' mentions nine strategies to combat child labour and the MDGs call for the protection of children against exploitation. In the MICS questionnaire, a number of questions addressed the issue of child labour, that is, children 5-14 years of age involved in labour activities. A child is considered to be involved in child labour activities at the moment of the survey if during the week preceding the survey:

- Ages 5-11: were involved in at least one hour of economic work or 28 hours of domestic work per week.
- Ages 12-14: were involved in at least 14 hours of economic work or 28 hours of domestic work per week.

This definition allows differentiation between child labour and child work to identify the type of work that should be eliminated. As such, the estimate provided here is a minimum of the prevalence of child labour since some children may be involved in hazardous labour activities for a number of hours that could be less than the numbers specified in the criteria explained above. Table CP.2 presents the results of child labour by the type of work. Percentages do not add up to the total child labour as children may be involved in more than one type of work.

In Kisumu County, 45 per cent of children aged 5-14 years are engaged in child labour. The proportion of children involved in child labour varies by the child's age, gender, area of residence, household wealth status and mother's education level. Children in the 5-11 years age group are more than five times more likely (59 per cent) to be involved in child labour activities than those of older age group (12-14 years) (11 per cent).

It is noteworthy that the proportion of children involved in child labour in rural areas (52 per cent) is double that in urban area (26 per cent). The proportion of children engaged in child labour is also higher amongst children whose mothers are uneducated (46 per cent) than amongst those whose mothers have primary (50 per cent) or secondary (41 per cent) level education. The data shows that children from the poorest households (60 per cent) are more likely to be engaged in child labour than those from the richest households (21 per cent). It is also noteworthy that the proportion involved in child labour is higher for girls (49 per cent) than boys (42 per cent).

The most common activities in which children are involved in include working for family businesses (59 per cent for 5 -11 year olds versus 72 per cent for the 12 – 14 year olds), economic activities of at least one hour (59 per cent for 5 -11 year olds versus 62 per cent for the 12 – 14 year olds) and household chores of less than 28 hours (47 per cent for 5 -11 year olds versus 74 per cent for the 12 – 14 year olds). A small proportion of children are involved in paid work with those in the older age group (12-14 years) having more proportions of involvement than their younger counterparts (5-11 years).

## Child labour and school attendance

Table CP.3 presents the percentage of children age 5-14 years classified as student labourers or as labourer students by selected characteristics. Student labourers are children who were attending school but at the same time involved in child labour activities at the time of the surveys. Among the 96 per cent of children aged 5-14 years attending school, 46 per cent are also involved in child labour activities (student labourers). On the other hand, of the 45 per cent of child labourers, the majority are attending school (96 per cent). This may indicate that being involved in child labour does not necessarily affect school attendance.

Yet, the rate of school attendance amongst the child labourers is exceptionally high across all demographic categories (over 90 per cent). The proportion of children from rural areas (52 per cent) who are engaged in child labour is higher than for those from urban areas (26 per cent). Similarly, the proportion of children involved in child labour in rural areas who are likely to attend school is 97 per cent which is comparable to 93 per cent for children in urban areas.

**Table CP.3: Child labour and school attendance**

## Child Discipline

As stated in 'A World Fit for Children', "children must be protected against any acts of violence". The Millennium Declaration calls for the protection of children against abuse, exploitation and violence. In the Kisumu County MICS survey, mothers/caretakers of children age 2-14 years were asked a series of questions on the different ways parents use to discipline their children when they misbehave.

Note that for the child discipline module, one child aged 2-14 per household was selected randomly during fieldwork. Out of these questions, the two indicators used to describe aspects of child discipline are: 1) the number of children 2-14 years that experience psychological aggression as punishment or minor physical punishment or severe physical punishment; and 2) the number of parents/caretakers of children 2-14 years of age that believe that in order to raise their children properly, they need to physically punish them.

In Kisumu county, about 4 out of 5 (82 per cent) of children age 2-14 years are subjected to at least one form of violent discipline method by their mothers/caretakers with 12 per cent being subjected to severe physical punishment and 56 per cent having experienced psychological discipline. The high prevalence of violent discipline is consistent with the observation that almost half (48 per cent) of mothers/caretakers believe that children should be physically punished. Non-violent discipline methods are applied for 9 per cent of 2-14 year old children in Kisumu County.

The method of child discipline varies with area of residence, gender and education of household head. The proportion of children subjected violent discipline is 81 per cent among girls and 84 per cent among boys. Whilst about 87 per cent of children in urban areas have experienced at least one form of violent discipline method, the corresponding proportion in rural areas is 81 per cent. About 92 per cent of children aged between 5 and 9 years were subjected to psychological aggression, severe physical discipline or any form of violent discipline versus 82 and 73 per cent for those aged 2-4 and 10-14 years of age.

**Table CP.4: Child discipline**

## Early Marriage and Polygyny

Marriage before the age of 18 is a reality for many young girls. According to UNICEF's worldwide estimates, over 64 million women aged 20-24 were married/in union before the age of 18. Factors that influence child marriage rates include: the state of the country's civil registration system, which provides proof of age for children; the existence of an adequate legislative framework with an accompanying enforcement mechanism to address cases of child marriage; and the existence of customary or religious laws that condone the practice.

In many parts of the world parents encourage the marriage of their daughters while they are still children in hopes that the marriage will benefit them both financially and socially, while also relieving financial burdens on the family. In actual fact, child marriage is a violation of human rights, compromising the development of girls and often resulting in early pregnancy and social isolation, with little education and poor vocational training reinforcing the gendered nature of poverty. The right to 'free and full' consent to a marriage is recognized in the Universal Declaration of Human Rights - with the recognition that consent cannot be 'free and full' when one of the parties involved is not sufficiently mature to make an informed decision about a life partner.

The Convention on the Elimination of all Forms of Discrimination against Women mentions the right to protection from child marriage in article 16, which states: "The betrothal and the marriage of a child shall have no legal effect, and all necessary action, including legislation, shall be taken to specify a minimum age for marriage..." While marriage is not considered directly in the Convention on the Rights of the Child, child marriage is linked to other rights - such as the right to express their views freely, the right to protection from all forms of abuse, and the right to be protected from harmful traditional practices - and is frequently addressed by the Committee on the Rights of the Child. Other international agreements related to child marriage are the Convention on Consent to Marriage, Minimum Age for Marriage and Registration of Marriages, the African Charter on the Rights and Welfare of the Child and the Protocol to the African Charter on Human and People's Rights on the Rights of Women in Africa. Child marriage was also identified as a type of commercial sexual exploitation of children by the Pan-African Forum against the Sexual Exploitation of Children.

Young married girls are a unique, though often invisible group. Child mothers face constrained decision-making and reduced life choices because they are required to perform heavy amounts of domestic work, are under pressure to demonstrate fertility and are responsible for raising children while they are still children themselves. Whilst boys are also affected by child marriage, this practice impact on girls to a far larger extent and intensity. Cohabitation – the situation in which a couple lives together as if married - raises the same human rights concerns as marriage. When a girl lives with a man and takes on the role of caregiver for him, the assumption is often that she has become an adult woman, even if she has not yet reached the age of 18. Additional concerns arise due to the informality of the relationship. For example, issues of inheritance, citizenship and social recognition make girls in informal unions vulnerable in more ways than those who are in formally recognized marriages.

Research suggests that many factors interact to place a child at risk of early marriage. Poverty, protection of girls, family honour and the provision of stability during unstable social periods are considered as significant factors in determining a girl's risk of becoming married while still a child. Women who married at younger ages are more likely to believe that it is sometimes acceptable for a husband to beat his wife and are more likely to experience domestic violence themselves. The age gap between partners is thought to contribute to these abusive power dynamics and to increase the risk of untimely widowhood.

Closely related to the issue of child marriage is the age at which girls become sexually active. Women who are married before the age of 18 tend to have more children than those who marry later in life. Pregnancy related deaths are known to be a leading cause of mortality for both married and unmarried girls between the ages of 15 and 19, particularly among the youngest in this cohort. There is evidence to suggest that girls who marry at young ages are more likely to marry older men which puts them at increased risk of HIV infection. Parents seek to marry off their girls to protect their honour, and men often seek younger women as wives as a means to avoid choosing a wife who might already be infected. The demand for this young wife to reproduce and the power imbalance resulting from the age differential leads to very low condom use among such couples.

Two of the indicators are the percentage of women married before 15 years of age and percentage married before 18 years of age. The percentage of women married at various ages and those in a polygynous union are provided in Table CP.5.

Table CP.5 shows that 12 per cent of women aged between 15 and 49 years are married before their 15th birthday. About 14 per cent of women in the 20-49 year age group are married before their 15th birthday and 42 per cent are married before the age of 18 years. About 1 in every 4 (24 per cent) adolescent girl's age 15-19 years is presently married/in union.

### **Trends in early marriage**

Table CP.6 presents the proportion of women who were first married or entered into a marital union before age 15 and 18 by residence and age groups. Examining the percentages married before age 15 and 18 by different age groups allow us to see the trends in early marriage over time.

Overall, 12 per cent of women age 15-49 years were married before the age of 15, and 42 per cent were married before the age of 18 years in Kisumu County. Among those in the 20-49 year age group, 14 per cent are married before the age of 15 years.

In Kisumu County, the proportion of urban women married before the age of 15 is 14 per cent compared to 10 per cent among rural counterparts. Similarly, 49 per cent of the urban women are married before age 18 as compared to 29 per cent among their rural counterparts. The proportion of women in the 15-19 year age group who are currently married or in union is 7 per cent in rural areas and 4 per cent in urban areas.

**Table CP.5: Early marriage and polygyny**

## Spousal age difference

The indicator of spousal age difference is the percentage of women who are 10 or more years younger than their current spouse. Table CP.7 presents the results of the age difference between husbands and wives.

About 38 per cent of women aged 20-24 years in Kisumu County are married to spouses who are 0-4 years older, 34 per cent to spouses who are 5-9 years older and 25 per cent to spouses who are 10 or more years older. Only 2 per cent of women are married to younger spouses. The proportion married to spouses who are more than 10 years older is 30 per cent in rural areas and 20 per cent in urban areas. Similarly, about 45 per cent of women age 15 -19 in Kisumu County are married to men who are 0-4 years older, 27 per cent to spouses who are 5-9 years older and 22 per cent to spouses who are 10 or more years older. The proportion married to spouses who are more than 10 years older in this category is 25 per cent in rural areas and 18 per cent in urban areas.

**Table CP.7: Spousal age difference**

## Female Genital Mutilation/Cutting

Female genital mutilation/cutting (FGM/C) is the partial or total removal of the female external genitalia or other injury to the female genital organs. FGM/C is always traumatic with immediate complications including excruciating pain, shock, urine retention, ulceration of the genitals and injury to adjacent tissue. Other complications include septicaemia, infertility, obstructed labour, and even death.

Female genital cutting or circumcision is widely practiced in many Kenyan communities. According to the KDHS, up to 27 per cent of women in Kenya are circumcised. The procedure is generally carried out on girls between the ages of 4 and 14. It is also done to infants, women who are about to be married and, sometimes, to women who are pregnant with their first child or who have just given birth. It is often performed by traditional practitioners, including midwives and barbers, without anaesthesia, using scissors, razor blades or broken glass.

FGM/C is a fundamental violation of human rights. In the absence of any perceived medical necessity, it subjects girls and women to health risks and has life-threatening consequences. Among those rights violated are the rights to the highest attainable standard of health and to bodily integrity. Furthermore, it could be argued that girls (under 18) cannot be said to give informed consent to such a potentially damaging practice as FGM/C.

Table CP.8 presents the prevalence of FGM/C among women and the type and extent of the procedure. Overall, the prevalence of FGM amongst women aged 15-49 years in Kisumu County is low with only slightly more than 2 per cent having experienced any form of FGM/C. The proportion of women who have undergone FGM/C does not vary by area of residence, age, level of education level or wealth status.

**Table CP.8: Female genital mutilation/cutting (FGM/C) among women**

## Approval of Female Genital Mutilation/Cutting

Table CP.10 presents the woman's attitudes towards FGM/C. As high as 77 per cent of the women aged 15-49 years have heard of FGM/C with a slightly higher proportion of the women who have heard of FGM/C residing in urban (82 per cent) than rural (76 per cent) areas. The proportion of women who have heard of FGM/C ranges from 94 per cent among those with no education to 73 per cent among those with primary level of education. Similarly this proportion ranges from 84 per cent among those from the richest wealth index households to 70 per cent among those from the fourth richest households. The proportion of women who have heard of FGM/C does not vary markedly within age groups.

Fourteen per cent of women aged 15-49 years believe the practice should be continued whilst 76 per cent believe it should be discontinued. The proportion of women who believe that FGM/C should be continued ranges from 17 per cent among those from rural areas to 11 per cent among those from urban areas. The data shows that more of the women who have had FGM/C (23 per cent) show more support for the continuity of this practice as compared to only 14 per cent of those who have not had FGM/C.

**Table CP.10: Approval of female genital mutilation/cutting (FGM/C)**

## Attitudes toward Domestic Violence

Women aged 15-49 years were asked a number of questions to assess their attitudes towards whether husbands are justified to hit or beat their wives/partners in a variety of scenarios. These questions were asked to give an indication of cultural beliefs that tend to be associated with the prevalence of violence against women by their husbands/partners. The main assumption here is that women who agree with the statements indicating that husbands/partners are justified to beat their wives/partners under the situations described in reality tend to be abused by their own husbands/partners. The responses to these questions can be found in Table CP.11.

**Table CP.11: Attitudes toward domestic violence**

a. County = KISUMU								

Overall, almost half (49 per cent) of the population of women aged 15-49 years in Kisumu County believe that their husbands/partners have a right to hit or beat them for at least one of a variety of reasons mentioned in Table CP.10. The common reasons reported for justifying domestic violence towards women are neglecting the children (39 per cent), arguing with him (24 per cent), going out without telling him (23 per cent), refusing to have sex with him (17 per cent) or burning the food (10 per cent). The proportion of women who believe that their husband/partner should beat them for any of the cited reasons is 53 per cent in rural areas and 42 per cent in urban areas.

Women who are currently married/in union are more likely to approve domestic violence than those who were formerly married or those who have never been married. The proportion of women approving domestic violence ranges from 22 per cent among those with no education, 57 per cent among those with primary and 43 per cent for those with secondary level education. On the other hand, the proportion of women approving domestic violence is lower amongst those from the richest households (40 per cent) than amongst those from the poorest households (53 per cent).

## **XII. HIV/AIDS, Sexual Behaviour, and Orphans**

---

### **Knowledge about HIV Transmission and Misconceptions about HIV/AIDS**

One of the most important prerequisites for reducing the rate of HIV infection is accurate knowledge of how HIV is transmitted and strategies for preventing transmission. Correct information is the first step toward raising awareness and giving young people the tools to protect themselves from infection. Misconceptions about HIV are common and can confuse young people and hinder prevention efforts. Different regions are likely to have variations in misconceptions although some appear to be universal (for example that sharing food can transmit HIV or mosquito bites can transmit HIV). The UN General Assembly Special Session on HIV/AIDS (UNGASS) called on governments to improve the knowledge and skills of young people to protect themselves from HIV. The indicators to measure this goal as well as the MDG of reducing HIV infections by half include improving the level of knowledge of HIV and its prevention, and changing behaviours to prevent further spread of the disease. The HIV module was administered to women 15-49 years of age.

One indicator which is both an MDG and UNGASS indicator is the per cent of young women who have comprehensive and correct knowledge of HIV prevention and transmission. In Kisumu County MICS, all women who have heard of AIDS were asked whether they knew of the three main ways of HIV prevention – having only one faithful uninfected partner, using a condom every time, and abstaining from sex. The results are presented in Table HA.1.

In Kisumu County, almost all of the interviewed women have heard of AIDS, however, only 7 in 10 (70 per cent) know of the three ways of preventing HIV transmission. The percentage of women who know of the two main ways of preventing HIV transmission is 79 per cent. Ninety per cent of women know of having one faithful uninfected sex partner, 86 per cent know about using a condom every time, and 83 per cent know abstaining from sex as main ways of preventing HIV transmission.

The proportion of women who know all three ways of preventing HIV transmission ranges from 68 per cent in rural areas to 74 per cent in urban areas. This proportion does not vary much across levels of the household wealth index.

Similarly, the proportion of women in urban areas who know both ways of preventing HIV transmission is 82 per cent versus 77 per cent for those from rural areas. Also, the proportion of women who know both ways of preventing HIV transmission is marginally higher among those who have ever been married or in union (81 per cent) than those who have never been married or in union (73 per cent). The proportion of women with knowledge of both ways of preventing HIV transmission ranges from 77 per cent among those with primary education to 81 and 85 per cent among those with secondary / higher and no education, respectively. The proportion of women with knowledge of both ways of preventing HIV transmission is comparable across household wealth quintiles. The figure ranges from 84 per cent among those from the poorest households to 79 per cent among those from the richest households.

**Table HA.1: Knowledge about HIV transmission, misconceptions about HIV/AIDS, and comprehensive knowledge about HIV transmission**

) Based on 25-49 unweighted cases

[1] MICS indicator 9.2; MDG indicator 6.3

( ) Based on 25-49 unweighted cases.

The results for women age 15-24 are separately presented in Table HA.2. About two thirds of young women (64 per cent) know of the three ways of HIV prevention, while about 3 quarters (76 per cent) know of the two main ways of HIV transmission. The proportion of women who know of the three ways of HIV prevention ranges from 59 per cent in rural areas to 73 per cent in urban areas.

About 1 in 9 (89 per cent) of young women know of having one faithful uninfected sex partner, 83 per cent know of using a condom every time, and 79 per cent know of abstaining from sex as main ways of preventing HIV transmission. The proportion of women aged 20 – 24 who know of the two main ways of HIV transmission is 80 per cent versus 71 per cent among those aged 15 – 19 years. Similarly, the proportion of women who know of the two main ways of HIV transmission ranges from 81 per cent among married or in union to 71 per cent among those who have never been married or in union. The proportion of young women who know both ways of preventing HIV transmission is 83 per cent for those from urban areas and 72 per cent for those from rural areas.

Table HA.1 and HA.2 also present the per cent of women who can correctly identify misconceptions concerning HIV. The indicator is based on the two most common and relevant misconceptions in Kisumu County -that HIV can be transmitted by mosquito bites or sharing food with someone with AIDS. The table also provides information on whether women know that HIV cannot be transmitted by supernatural means. Of the interviewed women, 68 per cent reject the two most common misconceptions and know that a healthy-looking person can be infected. Eighty-three (83) per cent of women know that HIV cannot be transmitted by mosquito bites, and 93 per cent of women know that HIV cannot be transmitted by sharing food with someone with AIDS, while 84 per cent of women know that a healthy-looking person can be infected.

Overall, there is a 10 per cent difference in the proportion of women in urban versus rural areas who reject the two most common misconceptions and know that a healthy looking person can have the AIDS virus (74 per cent versus 64 per cent). Knowledge of the two main ways of preventing HIV does not vary markedly by women's age, but varies across levels of household wealth index. For example, 61 per cent of women from the poorest households reject the two most common misconceptions and know that a healthy looking person can have the AIDS virus compared to 73 per cent among those from the richest households.

Women who have comprehensive knowledge about HIV prevention include women who know of the two ways of HIV prevention (having only one faithful uninfected partner and using a condom every time, who know that a healthy looking person can have the AIDS virus, and who reject the two most common misconceptions. Tables HA.1 and HA.2 present the percentage of women with comprehensive knowledge. The proportion of women aged 15-49 years with comprehensive knowledge of HIV prevention methods and transmission is still fairly low in Kisumu County (56 per cent); this figure is higher in urban areas (63 per cent) than in rural areas (52 per cent). Similarly, the proportion of women with comprehensive knowledge of HIV prevention methods and transmission ranges from 71 per cent among women with no education to 52 per cent among those with primary education-- see Figure HA.1.

**Figure HA.1: Percentage of women who have comprehensive knowledge of HIV/AIDS transmission by level of education, Kisumu County, 2011**

There is no major variation in comprehensive knowledge between women who have ever been married or in union and those who have never married or in union. Moreover, there is no variation in the proportion of women with comprehensive knowledge of HIV prevention and transmission and household wealth—except for the middle household wealth index (with only 45 per cent). Overall, comprehensive knowledge of HIV prevention and transmission is 51 per cent among women aged 15-24 years; the proportion with comprehensive knowledge does not vary markedly by background characteristics (Table HA.2).

Knowledge of mother-to-child transmission of HIV is also an important first step for women to seek HIV testing when they are pregnant to avoid infection in the baby. Women should know that HIV can be transmitted during pregnancy, delivery, and through breastfeeding. The level of knowledge among women age 15-49 years concerning mother-to-child transmission is presented in Table HA.3. Overall, 94 per cent of women know that HIV can be transmitted from mother to child. The percentage of women who know all three ways of mother-to-child transmission is 42 per cent, while 6 per cent of women did not know of any specific way.

The proportion of women with knowledge of all three ways of mother-to-child transmission is highest among women aged 25-29 years (46 per cent) and lowest among those aged 15-19 years (36 per cent). The proportion of women who know of all three ways of mother-to-child transmission is higher among those who have ever married or been in union (44 per cent) than for those who have never been married or in union (35 per cent). There is no major variation in the proportions of women with knowledge of all three ways of mother-to-child transmission and women's area of residence or education level and household wealth index.

**Table HA.3: Knowledge of mother-to-child HIV transmission**

Percentage of women age 15-49 years who correctly identify means of HIV transmission from mother to child, Kisumu County, 2011

[1] MICS indicator 9.3								

### Accepting Attitudes toward People Living with HIV/AIDS

The indicators on attitudes toward people living with HIV measure stigma and discrimination in the community. Stigma and discrimination are low if respondents report an accepting attitude on the following four questions: 1) would care for family member sick with AIDS; 2) would buy fresh vegetables from a vendor who was HIV positive; 3) thinks that a female teacher who is HIV positive should be allowed to teach in school; and 4) would not want to keep HIV status of a family member a secret.

Table HA.4 presents the findings on the attitudes of women towards people living with HIV/AIDS. In Kisumu County, almost all (99 per cent) of women who have heard of AIDS agree with at least one accepting attitude. The least common accepting attitude is 'not wanting to keep the HIV status of a family member a secret' (25 per cent).

**Table HA.4: Accepting attitudes toward people living with HIV/AIDS**

Percentage of women age 15-49 years who have heard of AIDS who express an accepting attitude towards people living with HIV/AIDS, Kisumu County, 2011								
		Per cent of women who:						Number of women who have heard of AIDS
		Are willing to care for a family member with the AIDS virus in own home	Would buy fresh vegetables from a shopkeeper or vendor who has the AIDS virus	Believe that a female teacher with the AIDS virus and is not sick should be allowed to continue teaching	Would not want to keep secret that a family member got infected with the AIDS virus	Agree with at least one accepting attitude	Express accepting attitudes on all four indicators [1]

[1] MICS indicator 9.4								

The proportion of women with accepting attitudes is higher amongst those from the richest households than amongst those from poorer households. For example, 25 per cent of women from the richest households express accepting attitudes on all four indicators whilst only 11 per cent of those from the poorest households do. A higher proportion of urban women express accepting attitudes (23 per cent) than their rural counterparts (17 per cent). Women with primary education (16 per cent) have varying accepting attitudes than those with secondary or higher (23 per cent) or no education (23 per cent).

### Knowledge of a Place for HIV Testing, Counselling and Testing during Antenatal Care

Another important indicator is the knowledge of where to be tested for HIV and use of such services. In order to protect them and to prevent others from infection, it is important for individuals to know their HIV status. Knowledge of one's status is also a critical factor in the decision to seek treatment. Questions related to knowledge among women in a facility for HIV testing and whether they have ever been tested is presented in Table HA.5.

In Kisumu County, 95 per cent of women know where to be tested, while 55 per cent have actually been tested. The proportion of women who know a place to get tested and who have ever been tested is comparable among rural and urban women.

The proportion of women who know a place to be tested is comparable across levels of education and marital status, but varies across household wealth index levels. Again, there is no notable variation in the proportion of those who have ever been tested based by marital status, but there differences across household wealth index. For example, among those from the poorest households, 44 per cent have ever been tested compared to 59 per cent among those from the richest households.

**Table HA.5: Knowledge of a place for HIV testing**

[2] MICS indicator 9.6				

Table HA.6 presents the same results for sexually active young women. The proportion of young women who have been tested and have been told the result provides a measure of the effectiveness of interventions that promote HIV counselling and testing among young people. This is important to know because young people may feel that there are barriers to accessing services related to sensitive issues such as sexual health.

About two thirds (66 per cent) of the women aged 15-24 years had had sex in the last 12 months preceding the survey but only 39 per cent of them had ever been tested, although nearly 96 per cent know of a place to get tested. About a third (33 per cent) of young women who had never been married or been in union had had sex in the last 12 months preceding the survey. Women who have never been married or been in union (63 per cent) were twice as likely to have ever been tested as those who have been married or in

union (31 per cent). The proportion of women who have ever been tested and those who have been tested and have been told the result does not vary markedly across urban and rural areas. The proportion of women who had had sex in the last 12 months preceding the survey is higher as expected among those aged 20-24 years (85 per cent) compared to those aged 15-19 years (45 per cent), but the proportion who have ever been tested is higher among the younger ones. Only 38 per cent of women have been tested and told the result.

**Table HA.6: Knowledge of a place for HIV testing among sexually active young women**

Percentage of women age 15-24 years who have had sex in the last 12 months, and among women who have had sex in the last 12 months, the percentage who know where to get an HIV test, percentage of women who have ever been tested and percentage of women who have been tested and have been told the result, Kisumu County, 2011

Among women who had given birth within the two years preceding the survey, the per cent who received counselling and HIV testing during antenatal care is presented in Table HA.7.

A very high proportion (95 per cent) of women who gave birth in the last two years received antenatal care from a health care professional during the last pregnancy. Eighty three per cent of all women received HIV counselling during antenatal care for last pregnancy and 81 per cent were offered an HIV test and were tested for HIV during antenatal care. In the Kisumu County MICS, a higher proportion of women (81 per cent) were offered an HIV test, tested for HIV during antenatal care and given the results. Overall, 81 per cent of women were offered an HIV test and were tested for HIV during antenatal care, and received the results. This proportion was higher in urban areas (89 per cent) versus rural areas (77 per cent). This pattern is comparable for women who received HIV counselling, were offered an HIV test, accepted and received the results.

**Table HA.7: HIV counselling and testing during antenatal care**

Among women age 15-49 who gave birth in the last 2 years, percentage of women who received antenatal care from a health professional during the last pregnancy, percentage who received HIV counselling, percentage who were offered and accepted an HIV test and received the results, Kisumu County, 2011

## Sexual Behaviour Related to HIV Transmission

Promoting safer sexual behaviour is critical in reducing HIV prevalence. The use of condoms during sex, especially with non-regular partners, is especially important in reducing the spread of HIV. In Kenya, over half of new HIV infections are among young people 15-24 years; thus a change in behaviour among this age group will be especially important to reduce new infections. A module of questions was administered to women 15-24 years of age to assess their risk of HIV infection. Risk factors for HIV include sex at an early age, sex with older men, sex with a non-marital non-cohabitating partner, and failure to use a condom. The findings on the frequency of sexual behaviours that increase the risk of HIV infection among women is presented in Table HA.8 and Figure HA.2.

**Table HA.8: Sexual behaviour that increases the risk of HIV infection**

Percentage of never-married young women age 15-24 years who have never had sex, percentage of young women age 15-24 years who have had sex before age 15, and percentage of young women age 15-24 years who had sex with a man 10 or more years older during the last 12 months, Kisumu County, 2011

Almost half (48 per cent) of 15-24 year old women who have never been married have never had sex. The proportion of women who have had sex amongst those who have never been married does not vary markedly between rural and urban areas. About one out of five (19 per cent) young women aged 15-24 years had sex before age 15. Eighteen per cent of young women aged 15-24 years had sex with a man who was 10 or more years older in the last 12 months.

**Figure HA.2: Sexual behaviour that increases risk of HIV infection, Nyanza Province, Kenya, 2011**

Sexual behaviour and condom use during sex with more than one partner was assessed in all women and separately for women aged 15-24 years who had sex with such a partner in the previous year (Tables HA.9 and HA.10). About 2 per cent of women 15-49 years of age report having sex with more than one partner in the last 12 months. Overall, 77 per cent of young women aged 15-24 have had sex, 66 per cent had sex in the last 12 months preceding the survey and less than 3 per cent had sex with more than one partner in the same period (Table HA.10).

**Table HA.9: Sex with multiple partners**

## Orphans

As the HIV epidemic progresses, more and more children are becoming orphaned and vulnerable because of AIDS. Children who are orphaned or in vulnerable households may be at increased risk of neglect or exploitation if the parents are not available to assist them. Monitoring the variations in different outcomes for orphans and vulnerable children and comparing them to their peers gives us a measure of how well communities and governments are responding to their needs. Orphans are defined as children under age 18 who have lost one or both parents.

The frequency of children living with neither parent, mother only, and father only is presented in Table HA.12. Over half (56 per cent) of children aged 0-17 years in Kisumu County live with both parents. There is no major difference between the proportions of male and female children who live with both parents; this finding is consistent with the national findings reported in the 2007 KAIS.

**Table HA.12: Children's living arrangements and orphanhood**

Per cent distribution of children age 0-17 years according to living arrangements, percentage of children age 0-17 years in households not living with a biological parent and percentage of children who have one or both parents dead, Kisumu County, 2011

[1] MICS indicator 9.17															
[2] MICS indicator 9.18															

The proportion of children living with both parents is higher in urban (62 per cent) than rural areas (54 per cent). The proportion of children living with both parents decreases with increasing age of child, but does not vary across levels of household wealth index.

Sixteen per cent of children aged below 18 years are not living with a biological parent. The proportions of children not living with a biological parent are comparable amongst male and female children, and slightly higher in rural (17 per cent) than urban areas (13 per cent). The proportion of children not living with a biological parent increases with increasing age of a child.

Overall, 1 out of 5 (20 per cent) children aged 0-17 years have lost one or both parents. The proportion does not vary markedly by gender, but varies by area of residence and age of the child. The proportion of children who have lost one or both parents is higher in rural (21 per cent) than urban areas (16 per cent) whilst it increases with increasing age of the child from 7 per cent amongst children aged 0-4 years to 35 per cent amongst those aged 15-17 years. The proportion of children who have lost one or both parents is lower in the richest wealth quintile than in poor ere wealth quintiles.

One of the indicators developed for the assessment of the status of orphaned children relative to their peers addresses the school attendance of 10-14 year old children who have lost both parents versus children whose parents are alive (and who live with at least one of these parents). If children whose parents have died do not have the same access to school as their peers, then families and schools are not ensuring that these children's rights are being met.

In Kisumu County, 7 per cent of children aged 10-14 years have lost both parents but the proportion does not vary markedly by gender of the child. (Table HA.13). Among those who have lost both parents, only 92 per cent are currently attending school. Nearly all (99 per cent) children aged 10-14 years who have not lost a parent and who live with at least one parent are attending school. This would suggest that double orphans are disadvantaged compared to the non-orphaned children in terms of school attendance; the orphans to non-orphans school attendance ratio is 0.93.

**Table HA.13: School attendance of orphans and non-orphans**

## Appendix A. Sample Design

---

The major features of the sample design are described in this appendix. Sample design features include target sample size, sample allocation, sampling frame and listing, choice of domains, sampling stages, stratification, and the calculation of sample weights.

The primary objective of the sample design for the Nyanza Multiple Indicator Cluster Survey was to produce statistically reliable estimates of most indicators, at the national level, for urban and rural areas, and for the 6 County regions (Siaya, Kisumu, Homa Bay, Migori, Kisii, Nyamira) of the province.

A multi-stage, stratified cluster sampling approach was used for the selection of the survey sample.

### Sample Size and Sample Allocation

The target sample size for the Nyanza MICS was calculated as 7500 households. For the calculation of the sample size, the key indicator used was the proportion of children with HAZ below -2 SD among children aged 0-59 months. The following formula was used to estimate the required sample size for this indicator:

$$n = \frac{[4 (r) (1-r) (f) (1.1)]}{[(0.13r)^2 (p) (n_h)]}$$

Where

- n is the required sample size, expressed as number of households
- 4 is a factor to achieve the 95 per cent level of confidence
- r is the predicted or anticipated prevalence (coverage rate) of the indicator
- 1.1 is the factor necessary to raise the sample size by 10 per cent for non-response
- f is the shortened symbol for deff (design effect)
- 0.13r is the margin of error to be tolerated at the 95 per cent level of confidence, defined as 13 per cent of r (relative sampling error of r)
- p is the proportion of the total population upon which the indicator, r, is based
- nh is the average household size.

For the calculation of the sample size, r (the proportion of children with HAZ below -2 SD among children aged 0-59 months) was assumed to be 30.9 per cent as per the 2008-09 KDHS. The value of *deff* (design effect) was taken as 1.4 based on the 2008-09 KDHS, p (percentage of children aged 0-59 months in Nyanza) was taken as 15 per cent and nh (average household size in Nyanza) was taken as 4.58. Both p and nh were based on the results from the 2009 Kenya Population Census. The margin of error to be tolerated at the 95 per cent level of confidence was fixed at 0.13r.

The resulting number of households from this exercise was 1187 households which is the sample size needed in each County. However, it was decided to sample 1250 households per County based on a number of considerations, including the possibility to improve on precision of low prevalence estimates at the County levels, budget available, and the time that would be needed per team to complete one cluster. Therefore dividing the total number of households by the number of sample households per cluster, it was calculated that a total of 52 clusters will be selected in each County giving a total of 300 EAs for the whole of Nyanza province.

Hence the overall sample size for MICS4 at the provincial level is  $6 \times 1250 = 7500$  households.

Equal allocation of the total sample size to the six regions was used. Therefore, 50 clusters were allocated to each region, with the final sample size calculated at 7500 households (50 clusters \* 6 counties \* 25 sample households per cluster). In each County, the clusters (primary sampling units) were distributed to urban and rural domains, proportional to the size of urban and rural populations in that region. The table below shows the allocation of clusters to the sampling strata.

**Table SD.1: Allocation of Sample Clusters (Primary Sampling Units) to Sampling Strata**

County	Total	Population (2009 Estimates)			Number of Clusters		
		Rural	Urban	Peri-urban	Urban	Rural	Total
Siaya	833984	745922	66605	21457	5	45	50
<b>Kisumu</b>	<b>952828</b>	<b>461145</b>	<b>291625</b>	<b>200053</b>	<b>27</b>	<b>23</b>	<b>50</b>
Homa Bay	955203	820029	62981	72193	7	43	50
Migori	907743	603728	125434	178581	18	32	50
Kisii	1142032	917260	87884	136888	11	39	50
Nyamira	592324	516335	23618	52371	7	43	50
<b>Total</b>					<b>75</b>	<b>225</b>	<b>300</b>

## Sampling Frame and Selection of Clusters

To attain the desired sample size, a two-stage stratified sampling design was used. The primary sampling units (PSUs) for the survey were the recently created enumeration areas (EAs) based on the 2009 Kenya Population and Housing Census with the households being the ultimate units. PSUs were selected from each of the sampling strata by using systematic pps (probability proportional to size) sampling procedures, based on the estimated sizes of the enumeration areas from the 2009 Population Census. The first stage of sampling was thus completed by selecting the required number of enumeration areas from each of the 6 counties, separately by urban and rural strata.

## Listing Activities

The sampling team created a stand-alone statistical frame for each of the Nyanza counties based on the 2009 census EAs for the purpose of MICS 4. To create the sampling frame, a complete listing of the selected EAs was undertaken by identifying and mapping all existing structures and households. The listing process ensured that the EAs had one measure of size (MoS). One MoS was defined as an EA having an average of 100 households. Prior to undertaking the fieldwork that informed the development of the frame, office processing of the EAs in the selected districts was done so that each EA with less than 50 households is amalgamated with the most convenient adjoining one. On the other hand, the EAs with more than 149 households were segmented during household listing and eventually one segment scientifically selected and developed into a cluster. From this master frame, households were selected to participate in the MICS4 main survey.

The listing and mapping teams were oriented in a 4 day training program in Kisumu, which included class room sessions and field practice. The training was facilitated by experts from KNBS and UNICEF. The listing and mapping team consisted of 12 teams; each having a lister and a mapper. The teams were led by a Supervisor, overseen by the District Statistical Officer (DSO) on a daily basis, who also attended the 4 days training programme. The County team was led by a County coordinator who was in charge of managing all the quality assurance activities of the teams in each County. One team was given two days to list an EA. The whole exercise of listing was also monitored by the UNICEF independent team that included a consultant.

## Selection of Households

Lists of households were prepared by the listing teams in the field for each enumeration area. The households were then sequentially numbered from 1 to n (the total number of households in each enumeration area) at the KNBS Office, where the selection of 25 households in each enumeration area was carried out using random systematic selection procedures.

## Calculation of Sample Weights

The Nyanza province Multiple Indicator Cluster Survey sample is not self-weighting. Essentially, by allocating equal numbers of households to each of the regions, different sampling fractions were used in each region since the size of the regions varied. For this reason, sample weights were calculated and these were used in the subsequent analyses of the survey data.

The major component of the weight is the reciprocal of the sampling fraction employed in selecting the number of sample households in that particular sampling stratum (h) and PSU (i):

$$W_{hi} = \frac{1}{f_{hi}}$$

The term  $f_{hi}$ , the sampling fraction for the i-th sample PSU in the h-th stratum, is the product of probabilities of selection at every stage in each sampling stratum:

$$f_{hi} = p1_{hi} \times p2_{hi} \times p3_{hi}$$

where  $p_{shi}$  is the probability of selection of the sampling unit at stage s for the i-th sample PSU in the h-th sampling stratum.

Since the estimated number of households in each enumeration area (PSU) in the sampling frame used for the first stage selection and the updated number of households in the enumeration area from the listing were different, individual sampling fractions for households in each sample enumeration area (cluster) were calculated. The sampling fractions for households in each enumeration area (cluster) therefore included the first stage probability of selection of the enumeration area in that particular sampling stratum and the second stage probability of selection of a household in the sample enumeration area (cluster).

A second component in the calculation of sample weights takes into account the level of non-response for the household and individual interviews. The adjustment for household non-response is equal to the inverse value of:

$$RR_h = \text{Number of interviewed households in stratum } h / \text{Number of occupied households listed in stratum } h$$

After the completion of fieldwork, response rates were calculated for each sampling stratum. These were used to adjust the sample weights calculated for each cluster. Response rates in the Nyanza province Multiple Indicator Cluster Survey are shown in Table HH.1 in this report.

Similarly, the adjustment for non-response at the individual level (women and under-5 children) for each stratum is equal to the inverse value of:

$$RR_h = \text{Completed women's (or under-5's) questionnaires in stratum } h / \text{Eligible women (or under-5s) in stratum } h$$

The non-response adjustment factors for women's and under-5's questionnaires are applied to the adjusted household weights. Numbers of eligible women and under-5 children were obtained from the roster of household members in the Household Questionnaire for households where interviews were completed.

The design weights for the households were calculated by multiplying the above factors for each enumeration area. These weights were then standardized (or normalized), one purpose of which is to make the weighted sum of the interviewed sample units equal the total sample size at the national level. Normalization is performed by dividing the aforementioned design weights by the average design weight at the national level. The average design weight is calculated as the sum of the design weights divided by the unweighted total). A similar standardization procedure was followed in obtaining standardized weights for the women's and under-5's questionnaires.

Sample weights were appended to all data sets and analyses were performed by weighting each household, woman or under-5 with these sample weights.

## Appendix B. List of Personnel Involved in the Survey

---

### Survey Director

A.K Kilele, Director General, KNBS 2011

### Technical Co-ordinators

James Gatungu, KNBS

## Appendix C. Estimates of Sampling Errors

---

The sample of respondents selected in the Kisumu County Multiple Indicator Cluster Survey is only one of the samples that could have been selected from the same population, using the same design and size. Each of these samples would yield results that differ somewhat from the results of the actual sample selected. Sampling errors are a measure of the variability between the estimates from all possible samples. The extent of variability is not known exactly, but can be estimated statistically from the survey data.

The following sampling error measures are presented in this appendix for each of the selected indicators:

- Standard error (*se*): Sampling errors are usually measured in terms of standard errors for particular indicators (means, proportions etc). Standard error is the square root of the variance of the estimate. The Taylor linearization method is used for the estimation of standard errors.
- Coefficient of variation (*se/r*) is the ratio of the standard error to the value of the indicator, and is a measure of the relative sampling error.
- Design effect (*deff*) is the ratio of the actual variance of an indicator, under the sampling method used in the survey, to the variance calculated under the assumption of simple random sampling. The square root of the design effect (*deff*) is used to show the efficiency of the sample design in relation to the precision. A *deff* value of 1.0 indicates that the sample design is as efficient as a simple random sample, while a *deff* value above 1.0 indicates the increase in the standard error due to the use of a more complex sample design.
- Confidence limits are calculated to show the interval within which the true value for the population can be reasonably assumed to fall, with a specified level of confidence. For any given statistic calculated from the survey, the value of that statistic will fall within a range of plus or minus two times the standard error ( $r + 2.se$  or  $r - 2.se$ ) of the statistic in 95 per cent of all possible samples of identical size and design.

For the calculation of sampling errors from MICS data, SPSS Version 18 Complex Samples module has been used. The results are shown in the tables that follow. In addition to the sampling error measures described above, the tables also include weighted and unweighted counts of denominators for each indicator.

Sampling errors are calculated for indicators of primary interest, for the national level, for the regions, and for urban and rural areas. Three of the selected indicators are based on households, 8 are based on household members, 13 are based on women, and 15 are based on children under 5. All indicators presented here are in the form of proportions. Table SE.1 shows the list of indicators for which sampling errors are calculated, including the base population (denominator) for each indicator. Tables [SE.2 to SE.9] show the calculated sampling errors for selected domains.

Table SE.1: Sampling errors: Kisumu County

Standard errors, coefficients of variation, design effects (deff), square root of design effects (deff) and confidence intervals for selected indicators, Kisumu County, 2011

## Appendix E. MICS4 Indicators: Numerators and Denominators

MICS4 INDICATOR		Module <sup>10</sup>	Numerator	Denominator	MDG <sup>11</sup>
<b>1. MORTALITY</b>					
1.1	Under-five mortality rate	CM	Probability of dying by exact age 5 years	MDG 4.1	MDG 4.1
1.2	Infant mortality rate	CM	Probability of dying by exact age 1 year	MDG 4.2	MDG 4.2
<b>2. NUTRITION</b>					
2.1a 2.1b	Underweight prevalence	AN	Number of children under age 5 who (a) fall below minus two standard deviations (moderate and severe) (b) fall below minus three standard deviations (severe) from the median weight for age of the WHO standard	Total number of children under age 5	MDG 1.8
2.2a 2.2b	Stunting prevalence	AN	Number of children under age 5 who (a) fall below minus two standard deviations (moderate and severe) (b) fall below minus three standard deviations (severe) from the median height for age of the WHO standard	Total number of children under age 5	
2.3a 2.3b	Wasting prevalence	AN	Number of children under age 5 who (a) fall below minus two standard deviations (moderate and severe) (b) fall below minus three standard deviations (severe) from the median weight for height of the WHO standard	Total number of children under age 5	
2.5	Early initiation of breastfeeding	MN	Number of women with a live birth in the 2 years preceding the survey who put the newborn infant to the breast within 1 hour of birth	Total number of women with a live birth in the 2 years preceding the survey	
2.6	Exclusive breastfeeding under 6 months	BF	Number of infants under 6 months of age who are exclusively breastfed <sup>12</sup>	Total number of infants under 6 months of age	
2.7	Continued breastfeeding at 1 year	BF	Number of children age 12-15 months who are currently breastfeeding	Total number of children age 12-15 months	
2.8	Continued breastfeeding at 2 years	BF	Number of children age 20-23 months who are currently breastfeeding	Total number of children age 20-23 months	

<sup>10</sup> Some indicators are constructed by using questions in several modules. In such cases, only the module(s) which contains most of the necessary information is indicated.

<sup>11</sup> MDG indicators as of February 2010

<sup>12</sup> Infants receiving breast milk, and not receiving any other fluids or foods, with the exception of oral rehydration solution, vitamins, mineral supplements and medicines

MICS4 INDICATOR		Module <sup>10</sup>	Numerator	Denominator	MDG <sup>11</sup>
2.13	Minimum meal frequency	BF	Number of children age 6-23 months receiving solid, semi-solid and soft foods (plus milk feeds for non-breastfed children) the minimum times <sup>13</sup> or more, according to breastfeeding status, during the previous day	Total number of children age 6-23 months	
2.15	Milk feeding frequency for non-breastfed children	BF	Number of non-breastfed children age 6-23 months who received at least 2 milk feedings during the previous day	Total number of non-breastfed children age 6-23 months	
2.16	Iodized salt consumption	SI	Number of households with salt testing 15 parts per million or more of iodide/iodate	Total number of households in which salt was tested or with no salt	
2.17	Vitamin A supplementation (children under age 5)	IM	Number of children age 6-59 months who received at least one high-dose vitamin A supplement in the 6 months preceding the survey	Total number of children age 6-59 months	
2.18	Low-birthweight infants	MN	Number of last live births in the 2 years preceding the survey weighing below 2,500 grams at birth	Total number of last live births in the 2 years preceding the survey	
2.19	Infants weighed at birth	MN	Number of last live births in the 2 years preceding the survey who were weighed at birth	Total number of last live births in the 2 years preceding the survey	
<b>3. CHILD HEALTH</b>					
3.1	Tuberculosis immunization coverage <sup>14</sup>	IM	Number of children age 12-23 months who received BCG vaccine before their first birthday	Total number of children age 12-23 months	
3.2	Polio immunization coverage	IM	Number of children age 12-23 months who received OPV3 vaccine before their first birthday	Total number of children age 12-23 months	
3.3	Immunization coverage for diphtheria, pertussis and tetanus (DPT)	IM	Number of children age 12-23 months who received DPT3 vaccine before their first birthday	Total number of children age 12-23 months	
3.4	Measles immunization coverage	IM	Number of children age 12-23 months who received measles vaccine before their first birthday	Total number of children age 12-23 months	MDG 4.3
3.6	Yellow fever immunization coverage	IM	Number of children age 12-23 months who received yellow fever vaccine before their first birthday	Total number of children age 12-23 months	

13 Breastfeeding children: Solid, semi-solid, or soft foods, two times for infants age 6-8 months, 3 times for children 9-23 months; Non-breastfeeding children: Solid, semi-solid, or soft foods, or milk feeds, four times for children age 6-23 months

14 Age groups used in indicators 3.1 to 3.6 are applicable when basic immunization schedules are used (with measles administered at 9 months). For the calculation of indicators when different schedules are used, see MICS4 manual for detailed descriptions

MICS4 INDICATOR		Module <sup>10</sup>	Numerator	Denominator	MDG <sup>11</sup>
3.7	Neonatal tetanus protection	MN	Number of women age 15-49 years with a live birth in the 2 years preceding the survey who were given at least two doses of tetanus toxoid vaccine within the appropriate interval <sup>15</sup> prior to giving birth	Total number of women age 15-49 years with a live birth in the 2 years preceding the survey	
3.8	Oral rehydration therapy with continued feeding	CA	Number of children under age 5 with diarrhoea in the previous 2 weeks who received ORT (ORS packet or recommended homemade fluid or increased fluids) and continued feeding during the episode of diarrhoea	Total number of children under age 5 with diarrhoea in the previous 2 weeks	
3.9	Care-seeking for suspected pneumonia	CA	Number of children under age 5 with suspected pneumonia in the previous 2 weeks who were taken to an appropriate health provider	Total number of children under age 5 with suspected pneumonia in the previous 2 weeks	
3.10	Antibiotic treatment of suspected pneumonia	CA	Number of children under age 5 with suspected pneumonia in the previous 2 weeks who received antibiotics	Total number of children under age 5 with suspected pneumonia in the previous 2 weeks	
3.11	Solid fuels	HC	Number of household members in households that use solid fuels as the primary source of domestic energy to cook	Total number of household members	
3.12	Household availability of insecticide-treated nets (ITNs) <sup>16</sup>	TN	Number of households with at least one insecticide treated net (ITN)	Total number of households	
3.14	Children under age 5 sleeping under any type of mosquito net	TN	Number of children under age 5 who slept under any type of mosquito net the previous night	Total number of children under age 5	
3.15	Children under age 5 sleeping under insecticide-treated nets (ITNs)	TN	Number of children under age 5 who slept under an insecticide-treated mosquito net (ITN) the previous night	Total number of children under age 5	MDG 6.7
3.18	Anti-malarial treatment of children under age 5	ML	Number of children under age 5 reported to have had fever in the previous 2 weeks who received any antimalarial treatment	Total number of children under age 5 reported to have had fever in the previous 2 weeks	MDG 6.8
3.19	Pregnant women sleeping under insecticide-treated nets (ITNs)	TN	Number of pregnant women who slept under an insecticide-treated net (ITN) the previous night	Total number of pregnant women	

<sup>15</sup> See MICS4 manual for a detailed description

<sup>16</sup> An ITN is (a) a factory treated net which does not require any treatment, (b) a pretreated net obtained within the past 12 months, or (c) a net that has been soaked with insecticide within the past 12 months

MICS4 INDICATOR		Module <sup>10</sup>	Numerator	Denominator	MDG <sup>11</sup>
3.20	Intermittent preventive treatment for malaria	MN	Number of women age 15-49 years who received at least 2 doses of SP/Fansidar to prevent malaria during antenatal care visits for their last pregnancy leading to a live birth in the 2 years preceding the survey	Total number of women age 15-49 years who have had a live birth in the 2 years preceding the survey	
3.21	Place for handwashing	HW	Number of households with a designated place for hand washing where water and soap are present	Total number of households	
3.22	Availability of soap	HW	Number of households with soap anywhere in the dwelling	Total number of households	
<b>4. WATER AND SANITATION</b>					
4.1	Use of improved drinking water sources	WS	Number of household members using improved sources of drinking water	Total number of household members	MDG 7.8
4.2	Water treatment	WS	Number of household members using unimproved drinking water who use an appropriate treatment method	Total number of household members in households using unimproved drinking water sources	
4.3	Use of improved sanitation facilities	WS	Number of household members using improved sanitation facilities	Total number of household members	MDG 7.9
4.4	Safe disposal of child's faeces	CA	Number of children age 0-2 years whose (last) stools were disposed of safely	Total number of children age 0-2 years	
<b>5. REPRODUCTIVE HEALTH</b>					
5.1	Adolescent birth rate	CM	Age-specific fertility rate for women age 15-19 years	MDG 5.4	
5.3	Contraceptive prevalence rate	CP	Number of women age 15-49 years currently married or in union who are using (or whose partner is using) a (modern or traditional) contraceptive method	Total number of women age 15-49 years who are currently married or in union	MDG 5.3
5.4	Unmet need <sup>17</sup>	UN	Number of women age 15-49 years who are currently married or in union who are fecund and want to space their births or limit the number of children they have and who are not currently using contraception	Total number of women age 15-49 years who are currently married or in union	MDG 5.6
5.5a 5.5b	Antenatal care coverage	MN	Number of women age 15-49 years who were attended during pregnancy in the 2 years preceding the survey (a) at least once by skilled personnel (b) at least four times by any provider	Total number of women age 15-49 years with a live birth in the 2 years preceding the survey	MDG 5.5

<sup>17</sup> See MICS4 manual for a detailed description

MICS4 INDICATOR		Module <sup>10</sup>	Numerator	Denominator	MDG <sup>11</sup>
5.7	Skilled attendant at delivery	MN	Number of women age 15-49 years with a live birth in the 2 years preceding the survey who were attended during childbirth by skilled health personnel	Total number of women age 15-49 years with a live birth in the 2 years preceding the survey	MDG 5.2
5.8	Institutional deliveries	MN	Number of women age 15-49 years with a live birth in the 2 years preceding the survey who delivered in a health facility	Total number of women age 15-49 years with a live birth in the 2 years preceding the survey	
<b>6. CHILD DEVELOPMENT</b>					
6.1	Support for learning	CE	Number of children age 36-59 months with whom an adult has engaged in four or more activities to promote learning and school readiness in the past 3 days	Total number of children age 36-59 months	
6.2	Father's support for learning	CE	Number of children age 36-59 months whose father has engaged in one or more activities to promote learning and school readiness in the past 3 days	Total number of children age 36-59 months	
6.3	Learning materials: children's books	CE	Number of children under age 5 who have three or more children's books	Total number of children under age 5	
6.5	Inadequate care	CE	Number of children under age 5 left alone or in the care of another child younger than 10 years of age for more than one hour at least once in the past week	Total number of children under age 5	
6.6	Early child development Index	CE	Number of children age 36-59 months who are developmentally on track in literacy-numeracy, physical, social-emotional, and learning domains	Total number of children age 36-59 months	
6.7	Attendance to early childhood education	CE	Number of children age 36-59 months who are attending an early childhood education programme	Total number of children age 36-59 months	
<b>7. LITERACY AND EDUCATION</b>					
7.1	Literacy rate among young women	WB	Number of women age 15-24 years who are able to read a short simple statement about everyday life or who attended secondary or higher education	Total number of women age 15-24 years	MDG 2.3
7.3	Net intake rate in primary education	ED	Number of children of school-entry age who enter the first grade of primary school	Total number of children of school-entry age	
7.4	Primary school net attendance ratio (adjusted)	ED	Number of children of primary school age currently attending primary or secondary school	Total number of children of primary school age	MDG 2.1
7.5	Secondary school net attendance ratio (adjusted)	ED	Number of children of secondary school age currently attending secondary school or higher	Total number of children of secondary-school age	

MICS4 INDICATOR		Module <sup>10</sup>	Numerator	Denominator	MDG <sup>11</sup>
7.7	Primary completion rate	ED	Number of children (of any age) attending the last grade of primary school (excluding repeaters)	Total number of children of primary school completion age (age appropriate to final grade of primary school)	
7.9	Gender parity index (primary school)	ED	Primary school net attendance ratio (adjusted) for girls	Primary school net attendance ratio (adjusted) for boys	MDG 3.1
7.10	Gender parity index (secondary school)	ED	Secondary school net attendance ratio (adjusted) for girls	Secondary school net attendance ratio (adjusted) for boys	MDG 3.1
<b>8. CHILD PROTECTION</b>					
8.1	Birth registration	BR	Number of children under age 5 whose births are reported registered	Total number of children under age 5	
8.2	Child labour	CL	Number of children age 5-14 years who are involved in child labour	Total number of children age 5-14 years	
8.3	School attendance among child labourers	ED - CL	Number of children age 5-14 years who are involved in child labour and are currently attending school	Total number of children age 5-14 years involved in child labour	
8.4	Child labour among students	ED - CL	Number of children age 5-14 years who are involved in child labour and are currently attending school	Total number of children age 5-14 years attending school	
8.5	Violent discipline	CD	Number of children age 2-14 years who experienced psychological aggression or physical punishment during the past month	Total number of children age 2-14 years	
8.6	Marriage before age 15	MA	Number of women age 15-49 years who were first married or in union by the exact age of 15	Total number of women age 15-49 years	
8.7	Marriage before age 18	MA	Number of women age 20-49 years who were first married or in union by the exact age of 18	Total number of women age 20-49 years	
8.8	Young women age 15-19 years currently married or in union	MA	Number of women age 15-19 years who are currently married or in union	Total number of women age 15-19 years	
8.9	Polygyny	MA	Number of women age 15-49 years who are in a polygynous union	Total number of women age 15-49 years who are currently married or in union	
8.10a 8.10b	Spousal age difference	MA	Number of women currently married or in union whose spouse is 10 or more years older, (a) for women age 15-19 years, (b) for women age 20-24 years	Total number of women currently married or in union (a) age 15-19 years, (b) age 20-24 years	
8.11	Approval for female genital mutilation/cutting (FGM/C)	FG	Number of women age 15-49 years favouring the continuation of female genital mutilation/cutting (FGM/C)	Total number of women age 15-49 years who have heard of FGM/C	

MICS4 INDICATOR		Module <sup>10</sup>	Numerator	Denominator	MDG <sup>11</sup>
8.12	Prevalence of female genital mutilation/ cutting (FGM/C) among women	FG	Number of women age 15-49 years who report to have undergone any form of female genital mutilation/cutting (FGM/C)	Total number of women age 15-49 years	
8.13	Prevalence of female genital mutilation/ cutting (FGM/C) among girls	FG	Number of girls age 0-14 years who have undergone any form of female genital mutilation/ cutting (FGM/C), as reported by mothers	Total number of girls age 0-14 years	
8.14	Attitudes towards domestic violence	DV	Number of women who state that a husband/partner is justified in hitting or beating his wife in at least one of the following circumstances: (1) she goes out without telling him, (2) she neglects the children, (3) she argues with him, (4) she refuses sex with him, (5) she burns the food	Total number of women age 15-49 years	
<b>9. HIV/AIDS, SEXUAL BEHAVIOUR AND ORPHANS</b>					
9.1	Comprehensive knowledge about HIV prevention	HA	Number of women age 15-49 years who correctly identify two ways of preventing HIV infection <sup>18</sup> , know that a healthy looking person can have HIV, and reject the two most common misconceptions about HIV transmission	Total number of women age 15-49 years	
9.2	Comprehensive knowledge about HIV prevention among young people	HA	Number of women age 15-24 years who correctly identify two ways of preventing HIV infection <sup>12</sup> , know that a healthy looking person can have HIV, and reject the two most common misconceptions about HIV transmission	Total number of women age 15-24 years	MDG 6.3
9.3	Knowledge of mother-to-child transmission of HIV	HA	Number of women age 15-49 years who correctly identify all three means <sup>19</sup> of mother-to-child transmission of HIV	Total number of women age 15-49 years	
9.4	Accepting attitudes towards people living with HIV	HA	Number of women age 15-49 years expressing accepting attitudes on all four questions <sup>20</sup> toward people living with HIV	Total number of women age 15-49 years who have heard of HIV	
9.5	Women who know where to be tested for HIV	HA	Number of women age 15-49 years who state knowledge of a place to be tested for HIV	Total number of women age 15-49 years	

<sup>18</sup> Using condoms and limiting sex to one faithful, uninfected partner

<sup>19</sup> Transmission during pregnancy, during delivery, and by breastfeeding

<sup>20</sup> Women (1) who think that a female teacher with the AIDS virus should be allowed to teach in school, (2) who would buy fresh vegetables from a shopkeeper or vendor who has the AIDS virus, (3) who would not want to keep it as a secret if a family member became infected with the AIDS virus, and (4) who would be willing to care for a family member who became sick with the AIDS virus

MICS4 INDICATOR		Module <sup>10</sup>	Numerator	Denominator	MDG <sup>11</sup>
9.6	Women who have been tested for HIV and know the results	HA	Number of women age 15-49 years who have been tested for HIV in the 12 months preceding the survey and who know their results	Total number of women age 15-49 years	
9.8	HIV counselling during antenatal care	HA	Number of women age 15-49 years who gave birth in the 2 years preceding the survey and received antenatal care, reporting that they received counselling on HIV during antenatal care	Total number of women age 15-49 years who gave birth in the 2 years preceding the survey	
9.9	HIV testing during antenatal care	HA	Number of women age 15-49 years who gave birth in the 2 years preceding the survey and received antenatal care, reporting that they were offered and accepted an HIV test during antenatal care and received their results	Total number of women age 15-49 years who gave birth in the 2 years preceding the survey	
9.10	Young women who have never had sex	SB	Number of never married women age 15-24 years who have never had sex	Total number of never married women age 15-24 years	
9.11	Sex before age 15 among young women	SB	Number of women age 15-24 years who have had sexual intercourse before age 15	Total number of women age 15-24 years	
9.12	Age-mixing among sexual partners	SB	Number of women age 15-24 years who had sex in the 12 months preceding the survey with a partner who was 10 or more years older than they were	Total number of women age 15-24 years who have had sex in the 12 months preceding the survey	
9.13	Sex with multiple partners	SB	Number of women age 15-49 years who have had sexual intercourse with more than one partner in the 12 months preceding the survey	Total number of women age 15-49 years	
9.15	Sex with non-regular partners	SB	Number of sexually active women age 15-24 years who have had sex with a non-marital, non-cohabitating partner in the 12 months preceding the survey	Total number of women age 15-24 years who have had sex in the 12 months preceding the survey	
9.16	Condom use with non-regular partners	SB	Number of women age 15-24 years reporting the use of a condom during sexual intercourse with their last non-marital, non-cohabiting sex partner in the 12 months preceding the survey	Total number of women age 15-24 years who had a non-marital, non-cohabiting partner in the 12 months preceding the survey	MDG 6.2
9.17	Children's living arrangements	HL	Number of children age 0-17 years not living with a biological parent	Total number of children age 0-17 years	
9.18	Prevalence of children with at least one parent dead	HL	Number of children age 0-17 years with at least one dead parent	Total number of children age 0-17 years

## INTRODUCTION

WE ARE FROM KENYA NATIONAL BUREAU OF STATISTICS (KNBS). WE ARE CONDUCTING A FAMILY HEALTH AND EDUCATION SURVEY. I WOULD LIKE TO TALK TO YOU ABOUT THIS. ALL THE INFORMATION WE OBTAIN WILL REMAIN STRICTLY CONFIDENTIAL AND YOUR ANSWERS WILL NEVER BE IDENTIFIED. MAY I START NOW?

*IF PERMISSION IS GIVEN, BEGIN THE INTERVIEW.*

HOUSEHOLD LISTING FORM										HL				
HL0.		<p>FIRST, PLEASE TELL ME THE NAME OF EACH PERSON WHO USUALLY LIVES HERE, STARTING WITH THE HEAD OF THE HOUSEHOLD. List the head of the household in line 01. List all household members (HL2), their relationship to the household head (HL3), and their sex (HL4)</p> <p>Then ask: ARE THERE ANY OTHERS WHO LIVE HERE, EVEN IF THEY ARE NOT AT HOME NOW? (THESE MAY INCLUDE CHILDREN IN SCHOOL OR AT WORK). If yes, complete listing.</p> <p>Then, ask questions starting with HL5 for each person at a time. Add a continuation sheet if there is not enough room on this page.</p> <p>Tick here if continuation sheet used <input type="checkbox"/></p>												
Record the time

WATER AND SANITATION		WS
WS1. WHAT IS THE MAIN SOURCE OF DRINKING WATER FOR MEMBERS OF YOUR HOUSEHOLD?	Piped water Piped into dwelling ..... 11 Piped into compound, yard or plot..... 12 Piped to neighbor ..... 13 Piped to water kiosk ..... 14 Public tap/standpipe..... 15 Tubewell/Borehole ..... 21 Dug well Protected well ..... 31 Unprotected well..... 32 Water from spring Protected spring ..... 41 Unprotected spring ..... 42 Rainwater collection ..... 51 Tanker-truck..... 61 Cart with small tank/drum ..... 71 Surface water (river, stream, dam, lake, pond, canal, irrigation channel)..... 81 Bottled water ..... 91 Other ( <i>specify</i> ) ..... 96	11—►WS5 12—►WS5 —►WS3 96—►WS3
WS2. WHAT IS THE MAIN SOURCE OF WATER USED BY YOUR HOUSEHOLD FOR OTHER PURPOSES SUCH AS COOKING AND HANDWASHING?	Piped water Piped into dwelling ..... 11 Piped into yard or plot ..... 12 Piped to neighbor ..... 13 Piped to water kiosk ..... 14 Public tap/standpipe..... 15 Tubewell/Borehole ..... 21 Dug well Protected well ..... 31 Unprotected well..... 32 Water from spring Protected spring ..... 41 Unprotected spring ..... 42 Rainwater collection ..... 51 Tanker-truck..... 61 Cart with small tank/drum ..... 71 Surface water (river, stream, dam, lake, pond, canal, irrigation channel)..... 81 Other ( <i>specify</i> ) ..... 96	11—►WS5 12—►WS5
WS3. HOW LONG DOES IT TAKE TO GO THERE, GET WATER, AND COME BACK?	No. of minutes ..... — — — Water on premises ..... 995 DK ..... 998	995—►WS5
WS4. WHO USUALLY GOES TO THIS SOURCE TO COLLECT THE WATER FOR YOUR HOUSEHOLD?	Adult woman (15+ years)..... 1 Adult man (15+ years) ..... 2 Female child (under 15) ..... 3 Male child (under 15)..... 4 DK ..... 8	
Probe: IS THIS PERSON UNDER AGE 15? WHAT SEX?		

WS5. DO YOU TREAT YOUR WATER IN ANY WAY TO MAKE IT SAFER TO DRINK?	Yes ..... 1 No ..... 2 DK ..... 8	2—►WS7 8—►WS7
WS6. WHAT DO YOU USUALLY DO TO THE WATER TO MAKE IT SAFER TO DRINK?  <i>Probe:</i> ANYTHING ELSE?  <i>Record all items mentioned.</i>	Boil ..... A Add bleach/chlorine ..... B Strain it through a cloth ..... C Use water filter (ceramic, sand, composite, etc.) ..... D Solar disinfection ..... E Let it stand and settle ..... F  Other (a) ..... X DK ..... Z	
WS7. WHAT KIND OF TOILET FACILITY DO MEMBERS OF YOUR HOUSEHOLD USUALLY USE?  <i>If “flush” or “pour flush”, probe:</i> WHERE DOES IT FLUSH TO?  <i>If necessary, ask permission to observe the facility.</i>	Flush/pour flush Flush to piped sewer system ..... 11 Flush to septic tank ..... 12 Flush to pit (latrine) ..... 13 Flush to somewhere else ..... 14 Flush to unknown place/not sure/DK where ..... 15 Ventilated Improved Pit latrine (VIP) ..... 21 Pit latrine with slab ..... 22 Pit latrine without slab/open pit ..... 23 Composting toilet ..... 31 Bucket ..... 41 Hanging toilet/hanging latrine ..... 51 No facilities or bush or field or ocean ..... 95  Other ( <i>specify</i> ) ..... 96	95—►NEXT MODULE
WS8. DO YOU SHARE THIS FACILITY WITH OTHER HOUSEHOLDS?	Yes ..... 1 No ..... 2	2—►NEXT MODULE
WS8A. DO YOU SHARE THIS FACILITY ONLY WITH OTHER HOUSEHOLDS THAT YOU KNOW, OR IS THE FACILITY OPEN TO THE USE OF THE GENERAL PUBLIC?	Other households only (not public) ..... 1 Public facility ..... 2	2—►NEXT MODULE
WS9. HOW MANY HOUSEHOLDS IN TOTAL USE THIS TOILET FACILITY?	No. of households (if less than 10) ..... 0 __  Ten or more households ..... 10 DK ..... 98	

HOUSEHOLD CHARACTERISTICS		HC
HC1A. WHAT IS THE RELIGION OF THE HEAD OF THIS HOUSEHOLD?	Roman Catholic..... 1 Protestant and Other Christian..... 2 Muslim..... 3 No Religion..... 4  Others ( <i>specify</i> )..... 6	
HC2. HOW MANY ROOMS IN THIS HOUSEHOLD ARE USED FOR SLEEPING?	No. of rooms..... — —	
HC3. MAIN MATERIAL OF THE DWELLING FLOOR:  <i>Record observation.</i>	Natural floor Earth/sand ..... 11 Dung ..... 12 Rudimentary floor Wood planks ..... 21 Palm/bamboo ..... 22 Finished floor Parquet or polished wood ..... 31 Vinyl or asphalt strips..... 32 Ceramic tiles ..... 33 Cement ..... 34 Carpet ..... 35  Other ( <i>specify</i> ) ..... 96	
HC4. MAIN MATERIAL OF THE ROOF.  <i>Record observation.</i>	Natural roofing No Roof..... 11 Grass/Thatch/Makuti ..... 12 Dung/Mud..... 13 Rudimentary Roofing Corrugated iron (Mabati)..... 21 Tin cans ..... 22 Finished roofing Asbestos sheet ..... 31 Concrete ..... 32 Tiles..... 33  Other ( <i>specify</i> ) ..... 96	
HC5. MAIN MATERIAL OF THE WALLS.  <i>Record observation.</i>	Natural walls No walls ..... 11 Cane/palm/trunks ..... 12 Dirt ..... 13 Rudimentary walls Bamboo with mud ..... 21 Stone with mud..... 22 Uncovered adobe ..... 23 Plywood ..... 24 Cardboard..... 25 Reused wood..... 26 Finished walls Cement ..... 31 Stone with lime/cement ..... 32 Bricks ..... 33 Cement blocks..... 34 Covered adobe ..... 35 Wood planks/shingles..... 36  Other ( <i>specify</i> ) ..... 96	2—►WS7 8—►WS7

HC6. WHAT TYPE OF FUEL DOES YOUR HOUSEHOLD MAINLY USE FOR COOKING?	Electricity .....	01	01 → HC9
	Liquefied Petroleum Gas (LPG) .....	02	02 → HC9
	Natural gas .....	03	03 → HC9
	Biogas .....	04	04 → HC9
	Kerosene .....	05	05 → HC9
	Coal / Lignite .....	06	
	Charcoal .....	07	
	Wood .....	08	
	Straw/shrubs/grass .....	09	
	Animal dung .....	10	
	Agricultural crop residue .....	11	
	Other ( <i>specify</i> ) .....	96	
	No food cooked in household .....	97	97 → HC9
HC8. IS THE COOKING USUALLY DONE IN THE INDOOR LIVING SPACE, IN A SEPARATE KITCHEN/BUILDING, OR OUTDOORS?	In a room used for living/sleeping .....	1	
	In a separate room used as kitchen .....	2	
	In a separate building used as kitchen .....	3	
	Outdoors .....	4	
	Other ( <i>specify</i> ) .....	6	
HC9. DOES YOUR HOUSEHOLD HAVE:		Yes	No
	A. ELECTRICITY?		
	Electricity .....	1	2
	B. RADIO?		
	Radio .....	1	2
	C. COLOR TELEVISION?		
	Color Television .....	1	2
	D. B&W TELEVISION?		
	B&W Television .....	1	2
	E. MOBILE TELEPHONE?		
	Mobile Telephone .....	1	2
	F. NON-MOBILE TELEPHONE?		
	Non-Mobile Telephone .....	1	2
	G. REFRIGERATOR?		
	Refrigerator .....	1	2
	H. BLENDER OR MIXER?		
	Blender or Mixer .....	1	2
	I. WATER HEATER?		
	Water Heater .....	1	2
	J. WASHING MACHINE?		
	Washing Machine .....	1	2
	K. COMPUTER?		
	Computer .....	1	2
	L. INTERNET CONNECTION?		
	Internet connection .....	1	2
	M. VCR, VCD OR DVD?		
	VCR, VCD or DVD .....	1	2
	N. AIR CONDITIONER?		
	Air Conditioner .....	1	2
	O. SEWING MACHINE?		
	Sewing Machine .....	1	2
HC10. DOES ANY MEMBER OF YOUR HOUSEHOLD OWN:		Yes	No
	A. A WATCH?		
	Watch .....	1	2
	B. A BICYCLE?		
	Bicycle .....	1	2
	C. A MOTORCYCLE OR SCOOTER?		
	Motorcycle/Scooter .....	1	2
	D. AN ANIMAL-DRAWN CART?		
	Animal drawn-cart .....	1	2
	E. A CAR OR TRUCK?		
	Car/Truck .....	1	2
	F. A BOAT WITH A MOTOR?		
	Boat with motor .....	1	2
HC10A. DO YOU OR SOMEONE LIVING IN THIS HOUSEHOLD OWN THIS DWELLING, OR DO YOU RENT THIS DWELLING?	Own .....	1	
	Rent .....	2	
	Rent free/squatter/other .....	3	
HC11. DOES ANY MEMBER OF THIS HOUSEHOLD OWN ANY LAND THAT CAN BE USED FOR AGRICULTURE?	Yes .....	1	2 → HC13
	No .....	2	

<p>HC12. HOW MANY ACRES OF AGRICULTURAL LAND DO MEMBERS OF THIS HOUSEHOLD OWN?</p> <p><i>If less than 1, record "00". If more than 97, record '97'. If unknown, record '98'.</i></p>	<p>Acres ..... ____ ____</p>

## CHILD DISCIPLINE

**Table 1: children Aged 2-14 YEARS ELIGIBLE for child Discipline questions**

Review the household listing and list each of the children aged 2-14 years below in order according to their line number (HL1). Do not include other household members outside of the age range 2-14 years. Record the line number, name, sex, and age for each child. Then record the total number of children aged 2-14 in the box provided (CD7).

CD1. Rank no.	CD2. Line no. from HL1	CD3. Name from HL2.	CD4. Sex from HL4.		CD5. Age from HL5.
RANK	LINE	NAME	M	F	AGE
1	__ __		1	2	__ __
2	__ __		1	2	__ __
3	__ __		1	2	__ __
4	__ __		1	2	__ __
5	__ __		1	2	__ __
6	__ __		1	2	__ __
7	__ __		1	2	__ __
8	__ __		1	2	__ __

<b>CD7.</b>	<b>TOTAL CHILDREN AGED 2-14 YEARS</b>	__
-------------	---------------------------------------	----

If there is only one child age 2-14 years in the household, then skip table 2 and go to CD9; write down the rank number of the child and continue with CD11

**Table 2: selection of random child for child Discipline questions**

Use this table to select one child between the ages of 2 and 14 years, if there is more than one child in that age range in the household. Look for the last digit of the household number from the cover page. This is the number of the row you should go to in the table below. Check the total number of eligible children (2-14) in CD7 above. This is the number of the column you should go to. Find the box where the row and the column meet and circle the number that appears in the box. This is the rank number of the child about whom the questions will be asked. Record the rank number in CD9 below. Finally, record the line number and name of the selected child in CD11 on the next page.

CD8.	TOTAL NUMBER OF ELIGIBLE CHILDREN IN THE HOUSEHOLD							
Last digit of the household number	1	2	3	4	5	6	7	8+
0	1	2	2	4	3	6	5	4
1	1	1	3	1	4	1	6	5

<b>CD9. Record the rank number of the selected child</b>	<b>Rank number of child</b> _____
--	-----------------------------------

CHILD DISCIPLINE		CD
Identify eligible child aged 2 to 14 in the household using the tables on the preceding page, according to your instructions.		
<b>CD11.</b> Write name and line no. of the child selected for the module from CD3 and CD2, based on the rank number in CD9.	Name _____ Line _____	
<b>CD12.</b> ALL ADULTS USE CERTAIN WAYS TO TEACH CHILDREN THE RIGHT BEHAVIOUR OR TO ADDRESS A BEHAVIOUR PROBLEM. I WILL READ VARIOUS METHODS THAT ARE USED AND I WANT YOU TO TELL ME IF YOU OR ANYONE ELSE IN YOUR HOUSEHOLD HAS USED THIS METHOD WITH (name) IN THE PAST MONTH.		
<b>CD12A.</b> TOOK AWAY PRIVILEGES, FORBADE SOMETHING (name) LIKED OR DID NOT ALLOW HIM/HER TO LEAVE HOUSE).	Yes ..... 1 No ..... 2	
<b>CD12B.</b> EXPLAINED WHY SOMETHING (THE BEHAVIOR) WAS WRONG.	Yes ..... 1 No ..... 2	
<b>CD12C.</b> SHOOK HIM/HER.	Yes ..... 1 No ..... 2	
<b>CD12D.</b> SHOUTED, YELLED AT OR SCREAMED AT HIM/HER.	Yes ..... 1 No ..... 2	
<b>CD12E.</b> GAVE HIM/HER SOMETHING ELSE TO DO.	Yes ..... 1 No ..... 2	
<b>CD12F.</b> SPANKED, HIT OR SLAPPED HIM/HER ON THE BOTTOM WITH BARE HAND.	Yes ..... 1 No ..... 2	
<b>CD12G.</b> HIT HIM/HER ON THE BOTTOM OR ELSEWHERE ON THE BODY WITH SOMETHING LIKE A BELT, HAIRBRUSH, STICK OR OTHER HARD OBJECT.	Yes ..... 1 No ..... 2	
<b>CD12H.</b> CALLED HIM/HER DUMB, LAZY, OR ANOTHER NAME LIKE THAT.	Yes ..... 1 No ..... 2	
<b>CD12I.</b> HIT OR SLAPPED HIM/HER ON THE FACE, HEAD OR EARS.	Yes ..... 1 No ..... 2	

<b>CD12J.</b> HIT OR SLAPPED HIM/HER ON THE HAND, ARM, OR LEG.	Yes..... 1 No ..... 2	
<b>CD12K.</b> BEAT HIM/HER UP WITH AN IMPLEMENT (HIT OVER AND OVER AS HARD AS ONE COULD).	Yes..... 1 No ..... 2	
<b>CD13.</b> DO YOU BELIEVE THAT IN ORDER TO BRING UP (RAISE, EDUCATE) (name) PROPERLY, YOU NEED TO PHYSICALLY PUNISH HIM/HER?	Yes..... 1 No ..... 2 Don't know/no opinion ..... 3	

DISABILITY										DA									
To be administered for all children 2 through 9 years old living in the household. For household members below age 2 or above age 9, leave rows blank I WOULD LIKE TO ASK YOU IF ANY CHILDREN IN THIS HOUSEHOLD AGED 2 THROUGH 9 HAS ANY OF THE HEALTH CONDITIONS I AM GOING TO MENTION TO YOU.																			
DA1. Line no.	DA2. Child's name and age	DA3. COMPARED WITH OTHER CHILDREN, DOES OR DID (name) HAVE ANY SERIOUS DELAY IN SITTING, STANDING, OR WALKING?	DA4. COMPARED WITH OTHER CHILDREN, DOES (name) HAVE DIFFICULTY SEEING, EITHER IN THE DAYTIME OR AT NIGHT?	DA5. DOES (name) APPEAR TO HAVE DIFFICULTY HEARING? (USES HEARING AID, HEARS WITH DIFFICULTY, COMPLETELY DEAF?)	DA6. WHEN YOU TELL (name) TO DO SOMETHING, DOES HE/SHE SEEM TO UNDERSTAND WHAT YOU ARE SAYING?	DA7. DOES (name) HAVE DIFFICULTY WALKING OR MOVING HIS/HER ARMS OR DOES HE/SHE HAVE WEAKNESS AND/OR STIFFNESS IN THE ARMS OR LEGS?	DA8. DOES (name) SOMETIMES HAVE FITS, BECOME RIGID, OR LOSE CONSCIOUSNESS?	DA9. DOES (name) LEARN TO DO THINGS LIKE OTHER CHILDREN HIS/HER AGE?	DA10. DOES (name) SPEAK AT ALL (CAN HE/SHE MAKE HIMSELF UNDERSTOOD IN WORDS; CAN SAY ANY RECOGNIZABLE WORDS)?	DA11. (For 3-9 year olds): IS (name)'S SPEECH IN ANY WAY DIFFERENT FROM NORMAL (NOT CLEAR ENOUGH TO BE UNDERSTOOD BY PEOPLE OTHER THAN THE IMMEDIATE FAMILY)?	DA12. (For 2-year olds): CAN (name) NAME AT LEAST ONE OBJECT (FOR EXAMPLE, AN ANIMAL, A TOY, A CUP, A SPOON)?	DA13. COMPARED WITH OTHER CHILDREN OF THE SAME AGE, DOES (name) APPEAR IN ANY WAY MENTALLY BACKWARD, DULL OR SLOW?

HANDWASHING FACILITY		HW
HW1. WE WOULD LIKE TO SEE THE PLACE WHERE MEMBERS OF YOUR HOUSEHOLD MOST OFTEN WASH THEIR HANDS? MAY I SEE THIS PLACE?	Place for hand washing observed ..... 1 No specific place for hand washing ..... 2 No permission to see ..... 3	2—►HW5 3—►HW5
HW1A. Place where household members most often wash their hands?  <i>Ask to see and observe. Record only one hand washing place. This is the hand washing place most often used by household members. Estimate the distance of "within 10 paces".</i>	Inside Toilet facility ..... 01 Kitchen/Cooking place ..... 02 Within 10 paces of Both toilet and kitchen ..... 03 Toilet facility (but farther from kitchen) ..... 04 Kitchen (but farther from toilet facility) ..... 05 Elsewhere Elsewhere in home or yard ..... 06 Elsewhere outside the yard ..... 07  Other (specify) ..... 96	
HW2. Water available at the place for hand washing?  <i>If there is a tap or pump at the specific place for hand washing, open the tap or operate the pump to see if water is coming out. If there is a bucket, basin or other type of water container, examine to see whether water is present in the container. Record observation.</i>	Water available ..... 1 Water not available ..... 2	
HW3. Soap or detergent present at the specific place for hand washing?  <i>Record observation. Circle all that apply.</i>	Bar soap ..... A Detergent (powder/liquid/paste) ..... B Liquid soap ..... C None ..... Y	A—►NEXT MODULE B—►NEXT MODULE C—►NEXT MODULE D—►NEXT MODULE
HW5. DO YOU HAVE ANY SOAP OR DETERGENT IN YOUR HOUSEHOLD FOR WASHING HANDS?	Yes ..... 1 No ..... 2	2—►NEXT MODULE
HW6. CAN YOU PLEASE SHOW IT TO ME?  <i>Record observation. Circle all that apply</i>	Bar soap ..... A Detergent (powder/liquid/paste) ..... B Liquid soap ..... C Not able/Does not want to show ..... Y	

SALT IODIZATION		SI
<p>SI1. WE WOULD LIKE TO CHECK WHETHER THE SALT USED IN YOUR HOUSEHOLD IS IODIZED. MAY I SEE A SAMPLE OF THE SALT USED TO COOK THE MAIN MEAL EATEN BY MEMBERS OF YOUR HOUSEHOLD LAST NIGHT?</p> <p>MAY I TEST A SAMPLE OF THIS SALT?</p> <p><i>Once you have examined the salt, circle number that corresponds to test outcome.</i></p>	<p>Not iodized 0 PPM ..... 1</p> <p>Less than 15 PPM ..... 2</p> <p>15 PPM or more ..... 3</p> <p>No salt in home ..... 6</p> <p>Salt not tested ..... 7</p>	

SI1A. Record the time.	Hour and minutes	__ : __
------------------------	------------------	---------

SI2. Does any eligible woman age 15-49 reside in the household?  
Check household listing, column HL6. You should have a questionnaire with the Information Panel filled in for each eligible woman.

[ ] Yes. —► Go to women's Questionnaire to administer the questionnaire to the first eligible woman.. If this woman has a child under age 5, continue to interview her on her under-5 child(ren)

[ ] No. —► Continue.

SI3. Does any child under the age of 5 reside in the household?  
Check household listing, column HL8. You should have a questionnaire with the Information Panel filled in for each eligible child.

[ ] Yes. —► Go to Under-5 Questionnaire to administer the questionnaire to mother or caretaker of the first eligible child.

[ ] No. —► End the interview by thanking the respondent for his/her cooperation. Gather together all questionnaires for this household and tally the number of interviews completed on the cover page.
